Applicants will be contacted. The approval process will be under way.

FEDERAL NEWS

NEW REGULATIONS TO BE FINALISED BY THE END OF THE YEAR

THE LONG-AWAITED NEW REGULATIONS FOR THE AMATEUR RADIO SERVICE IN AUSTRALIA LOOK LIKE BEING COMPLETED BY THE END OF THE YEAR.

THIS WAS THE HOPE EXPRESSED BY SPECTRUM MANAGEMENT AGENCY REPRESENTATIVE PETER STACKPOLE WHO WAS THE GUEST SPEAKER AT THE W.I.A. FEDERAL ANNUAL CONVENTION DINNER LAST WEEKEND.

MR STACKPOLE EXPLAINED THE DELAY HAD BEEN CAUSED PRIMARILY BY THE RESTRUCTURING OF THE FORMER DEPARTMENT OF TRANSPORT AND COMMUNICATIONS, NOW THE S.M.A.

THE NEW REGULATIONS WERE FIRST PUBLICLY FORESHADOWED NEARLY 18 MONTHS AGO.

THE MAIN AIM OF THE EXERCISE IS TO SIMPLIFY THE PRESENT LICENSING CONDITIONS.

THE NEW REGULATIONS ARE STILL EXPECTED TO INCLUDE THE INTRODUCTION OF A NO-CODE NOVICE LICENCE AND REVIEW OF THE FREQUENCY ALLOCATIONS AND PRIVILEGES FOR THE LIMITED, COMBINED AND NOVICE LICENCES.

A FURTHER BIT OF GOOD NEWS FOR AMATEURS WAS RELAYED BY MR STACKPOLE: THE S.M.A. HAS PROPOSED AN ELECTROMAGNETIC COMPATIBILITY FRAMEWORK FOR AUSTRALIA.

THIS MEANS THAT THERE WILL BE MANDATORY STANDARDS INTRODUCED FOR ALL ELECTRICAL AND ELECTRONIC EQUIPMENT THAT EMITS RADIO FREQUENCY ENERGY WHICH IS NOT PART OF ITS PURPOSE.

EXAMPLES INCLUDE ELECTRIC MOTOR DRIVEN APPLIANCES SUCH AS DRILLS AND FOOD PROCESSOR, AND OTHER EQUIPMENT SUCH AS PERSONAL COMPUTERS.

THE ELECTROMAGNETIC COMPATIBILITY REQUIREMENTS ARE PLANNED TO BE EFFECTED FROM JANUARY 1996, BUT WILL NOT BE RETROSPECTIVE.

THE E.M.C. FRAMEWORK IS PROPOSED TO APPLY FOR ALL EQUIPMENT MANUFACTURED IN OR IMPORTED INTO AUSTRALIA.

IT WILL ALSO DEVELOP IMMUNITY STANDARDS FOR EQUIPMENT LIKELY TO BE AFFECTED BY ELECTROMAGNETIC INTERFERENCE.

THIS WILL APPLY TO EQUIPMENT SUCH AS DOMESTIC TELEVISION RECEIVERS AND VIDEO RECORDERS, FOR EXAMPLE.

MR STACKPOLE ALSO REMINDED W.I.A. DELEGATES AND GUESTS AT THE DINNER ABOUT THE S.M.A. DECISION TO TOUGHEN INTERFERENCE REGULATIONS.

THE S.M.A. PLANS TO INCLUDE IN THE REGULATIONS NEW PROVISIONS RELATING TO THE OPERATION OF AMATEUR STATIONS IN REGARDS TO INTERFERENCE.

MR STACKPOLE SAID THESE PROVISIONS ARE BEING PROPOSED TO ENCOURAGE RADIO AMATEURS TO TAKE MORE RESPONSIBILITY IN THE RESOLUTION OF INTERFERENCE CAUSED BY THEIR TRANSMISSIONS.

THE PHILOSOPHY BEHIND THE S.M.A.'S THINKING IS THAT RADIO AMATEURS AND THOSE SUFFERING INTERFERENCE MUST WORK TOGETHER TO RESOLVE INTERFERENCE PROBLEMS.

BECAUSE AN AMATEUR TRANSMISSION IS SPECTRALLY CLEAN, WILL NOT IN THE FUTURE BE A DEFENCE IN CASES WHERE INTERFERENCE IS BEING SUFFERED BY A NEIGHBOUR.

GUIDELINES FOR RESOLVING INTERFERENCE PROBLEMS WILL BE DEVELOPED.

THE N.S.W. DIVISION WILL BE WATCHING THIS MATTER CLOSELY.

OUTBACK RADIO GETS A BOOST

THE 2.5 MILLION RESIDENTS OF AUSTRALIA'S OUTBACK COUNTRY ARE TO GET IMPROVED COMMUNICATIONS WITH THE RECENT INTRODUCTION OF NEW SERVICES.

MANY OF THESE OUTBACK RESIDENTS RELY ON HIGH FREQUENCY RADIOS FOR COMMUNICATIONS AND HAVE EITHER NO ACCESS OR VERY LIMITED ACCESS TO THE TELEPHONE SERVICE.

THERE ARE MORE THAN 80,000 HF RADIOS USED FOR THIS PURPOSE ACROSS AUSTRALIA.

TELSTRA - THE CORPORATE NAME OF THE COMMUNICATIONS COMPANY OTHERWISE KNOWN TO YOU AND ME AS TELECOM AUSTRALIA - HAS INTRODUCED TWO SERVICES: ONE IS SATELLITE-BASED AND CALLED SATCOM-M; THE OTHER USES HF COMMUNICATIONS AND IS CALLED RADPHONE DIRECT DIAL.

WITH THE NEW HF RADPHONE SERVICE ALLOWS USERS TO DIAL DIRECTLY TO JUST ABOUT ANY TELEPHONE NUMBER IN AUSTRALIA.

LATER THIS YEAR, THE FACILITY TO SEND FAXES AND DIGITAL DATA WILL BE ADDED.

THE PRACTISE OF OUTBACK HF USERS HAVING TO CALL A BASE STATION TO PLACE A PHONE CALL WILL DIE OUT.

THE SATELLITE-BASED SATCOM-M SERVICE EMPLOYS TERMINALS THE SIZE OF A BRIEFCASE, INCLUDING THE ANTENNA.

THE HF TERMINALS FOR THE RADPHONE DIRECT DIAL SERVICE COST ABOUT THE SAME AS TOP-LINE, MULTIBAND HF AMATEUR RIGS, WHILE THE SATELLITE TERMINALS COST ABOUT FIVE TIMES AS MUCH.

ONCE YOU'VE GOT OVER THAT LITTLE HURDLE, THEN THERE'S THE PHONE BILLS.....

GTOR (conclusion) reprinted from RTTY Digital Journal ------------

On-The-Air Testing

During the month of January over a million bytes were
transferred error-free from Lawrence, Kansas to Laguna Niguel,
California. During these tests, TRACE was set ON at each
station, enabling the display of acknowledgement bytes and
data frames including control bytes. This allowed us to view
and count data and acknowledgement frames received with and
without the aid of forward error correction and interleaving.

The results were somewhat surprising! While Pactor often
dropped in transmission speed from 200 to 100 baud, G-TOR
nearly always kept on crunching frames at 300 baud! Enough
frames are corrected to keep the system running at 300 baud,
regardless of man-made interference and mild multi-path condi-
tions. Transfer duration for the entire test file varied from
12 to 27 minutes for Pactor but only 5.5 to 7.5 minutes for
all but one transfer in G-TOR. G-TOR simply maintained its
highest pace better than Pactor, resulting in a substantial
increase in average throughput.

Operation of G-TOR is much like AMTOR. Establish a link by
typing (GTOR callsign) and (return) at the cmd: prompt. Enter
standby to copy CQs or to receive a link request by typing
(GTOR) and (Return). Tune to a G-TOR CQ call as you would in
AMTOR. G-TOR uses the AMTOR FEC mode for calling CQ and as its
broadcast mode. Change the direction of information flow using

the directives (Control-C T) and (control-C E).
Conclusion
G-TOR features include Golay forward error correction coding, full-frame interleaving, on-the-fly Huffman data compression with run-length encoding, fuzzy acknowledgments, a long hybrid-ARQ cycle of 2.4 seconds, and a link-quality based transmission rate. Combined, these techniques result in a new, very robust, interference-resistant mode for HF digital communication for the amateur radio service. Throughput exceeds other existing all-mode TNC modes by better than two-to-one.

G-TOR will be standard in the KAM Plus and the Enhancement board for the KAM (predecessor of the KAM Plus). G-TOR will not be available for KAMs without the enhancement board since EPROM space is too small. Firmware EPROM updates will be available for the KAM Plus and KAM with Enhancement board.
G-TOR is a trademark of Kantronics, Inc.

Editor's note : there is a critique of G-TOR on the packet system here at the moment. In the interests of amateurs who do not have access to packet, we will run this item following the completion of this review so as to have another viewpoint on this new system.

VOLTA RTTY WW Contest

Contest period: from 1200z Saturday to 1200Z Sunday 14-15 May (24 hours, no rest periods required)

Bands: 80, 40, 20, 15 and 10M

Classes: A1 - Single op, all bands
A2/xx - Single op, single band (xx = band)
B - Multi-op, single transmitter
C - SWL

Exchange : Send : RST plus QSO nr. plus CQ zone nr.

Multipliers: DXCC Country List plus each call area in VK, VE and USA.
DO NOT COUNT VK, VE , or USA as separate country. (USA stations with callsigns from one district but are now living in a different district should give proper identification, such as :K6WZ/0.) The same multiplier counts again on a new band. An additional multiplier is given for each INTERCONTINENTAL COUNTRY worked on at least four bands. Contacts between stations within the same country will not be valid, such as: a W2 station can work W1, W3, W4 etc. but not W2. Contacts made OUTSIDE ones own continent on 80 or 10M are worth double QSO points. A contact with a station that would

count as a multiplier will be valid if that station appears in at least 4 other logs, or a contest log is received from that station.

SUMMARY OF ACTIVITY

Solar activity was very low during the period.

The geomagnetic field at Learmonth (WA) was quiet on 29th-30th April, unsettled to minor storm 1st-2nd May, and unsettled to active 3rd-5th with a brief minor storm period on 3rd.

Ionospheric F2 critical frequencies at Sydney were near predicted monthly values 29th-30 April, near normal to 30 per cent enhanced on 1st May, depressed by up to 30 per cent on 2nd, returning to near normal to 20 per cent enhanced on 3rd. On 4th-5th May, frequencies were near normal to 30 per cent depressed.

Spread F was observed on 2nd and 4th-5th May, and blanketing sporadic E conditions obtained at times on 2nd May.

FORECAST FOR THE NEXT WEEK (6 - 12 May)

SOLAR: Very low

GEOMAGNETIC: Unsettled to active

IONOSPHERIC Near predicted monthly values.

VK2SG RTTY DX NOTES 29 APR 94

VK2SG RTTY DXNOTES FOR WEEKENDING 29 APR. 1994 (BID RTDX0429)

THIS HAS BEEN ONE OF THOSE WEEKS WHERE NOTHING HAS HAPPENED,
SO
I TOOK LIBERTY TO LOOK AROUND THE BANDS. ONE WONDERS AT TIMES
ABOUT THE OPERATIONS OF SOME PEOPLE, IT WOULD APPEAR THAT, AT
THE MOMENT, THE BIG GAME IS TO JAM OTHER STATIONS. IT HAS
BEEN NOTICED THAT THERE ARE LOTS OF SIGNALS THAT JUST IDLE
ON TOP OF STATIONS THAT ARE TRYING TO ESTABLISH A CONTACT.
SOME OTHER OPERATOR SEEM TO SPEND A LOT OF TIME JUST LISTING
BULLETINS IN EVERY MAILBOX THAT CAN FIND, WELL EACH ONE IS
ENTITLED TO DO THAT, BUT IT SURE SEEMS TO ANNOY SOME PEOPLE.

OUR THANKS THIS WEEK GO TO: ZS5S, W2JGR, WB2CJL, VK2SG, OH2BBF
ON6RO, DJ3IW AND THE CENTRAL-EU. DXCLUSTER NODE DB0SPC, I5ICY
AND IK5PWJ PACKETCLUSTER AND THE NJ0M NODE OF THE TWIN CITIES.

IN KIGALI GOING WHICH ASSISTED GREATLY DURING THE EVACUATION

OPERATIONS.JACQUES WAS HOPITALISED FOR MALARIA AND HEPATITIS. BOTH, MONIQUE AND JACQUES ARE TOUCHED BY ALL SEND MESSAGES OF OF SYMPATHY THEY HAVE RECEIVED. THEY ARE VERY GRATEFUL FOR THEM AND SEND THEIR REGARDS TO ALL OF YOU. THE BOX WAS STILL RUNNING ON THE 25TH APR. 21073 ON AMTOR.

MARKET REEF. ERIC OJ0/OH2BBF PLANS TO AIR SOME RTTY FROM 15TH TO 16TH MAY FROM MARKET REEF. OJ0/OH1VR, OJ0/AC6T, OJ0/OH6RM AND OH0MB WILL BE ON SSB/CW, OJ0/OH1VR ALSO ON 6 METERS, 14TH TO 17TH MAY. (OH0MB IS THE CURRENT MARKET REEF CALL OF LARS, OH0RJ). OPERATION IS PENDING FROM WEATHER DUE TO HELICOPTER TRANSPORTATION.

VOLTA RTTY TEST. HONORING ITALIAN DISCOVERER OF ELECTRICITY, ALESSANDRO VOLTA, I REMIND YOU THIS CONTEST WHICH WILL START FROM 1200Z MAY 14TH AND WILL END 1200Z OF MAY 15TH. EXCHANGE RST, QSO NUMBER AND CQ ZONE NUMBER.

GENEVA. AN ITALIAN TEAM WILL BE ACTIVE FROM ITU HEADQUARTERS MAY 20-22TH USING SPECIAL CALL 4U9ITU ON CW, SSB AND RTTY.

SEND YOUR BANDPASS AND NOTES FOR NEXT WEEK BULLETIN TO JULES, W2JGR AT W2TKU.#SRQFL.FL.USA.NA.

GL DE (DX2) LUCIANO, I5FLN AT ZS5S.ZAF.AF

Editors Note

Lucianos comments apply here as much as overseas. What has happened to the Amateurs code of respecting others rights? All that is required is to choose a frequency in that segment of the band set aside for the mode you want to use, and to take a moment or two to listen for any traffic to see that the frequency is clear. Not too much to ask, is it?

Surely amateurs of today can abide by the gentlemans code and make the hobby pleasant and friendly for all.

Coming events

1994

May 14th-15th Volta RTTY WW Contest

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065 Australia, for such matters as membership and general enquiries. Enquiries can also be made by packet to the President (Col) VK2CTD, or the Secretary (Pat) VK2JPA @ VK2RWI

or whatever BBS is providing the alternative communication.

News items may be sent to Broadcast Officer PO Box 60
Blacktown 2148 Australia, or by packet to VK2JPA as per the
above outline.
Email address for the Broadcast Officer is:

patl@pitt.conmusic.su.oz.au

The Society welcomes news items on any digital subjects from
anywhere in the broadcast footprint. We know we reach ZL and
South Pacific islands. We are looking forward to news from
your areas to let other amateurs know what you are doing in the
hobby. Hope to hear from you.

73s de Pat VK2JPA Broadcast Officer
That concludes ANARTS NEWS 808 08/05/94.

To assist an analysis of our distribution, if you use this means
of obtaining a copy of the bulletins, a VERY BRIEF note would be
appreciated. Simply your call and via ??????BBS would be
sufficient- Send via Packet through VK2DAA, or Amtor through
VK2AGE, I monitor them both weekly......Additional comments will
be read with interest.

Inserted by VK2BQS (Jim) Vice President ANARTS.

Inmarsat-M phones digitize voice in 4.8 kBaud, but they use spread-spectrum
in stead of normal single channel transmission.

But nevertheles it must be possible to use digital voice over
a 10 kHz FM channel.

Gerrit, PA3BYA.

>Our licenses are lifetime, too. It's the *station* license that costs $26
>per annum.

No, it's your "certificate of proficiency" that does not expire.

BTW, my station licence cost $24.00 to renew this year. I think that that
some commercial people (boaters and such) pay $26.00 for their station
licence.

This frequency range is still used by volunteer fire and rescue squads in
rural areas. And MOST IMPORTANTLY by STATE POLICE AGENCIES. While some
states, like VA, have moved their SPD to 159 MHz, there are still a good
deal of frequencies and states using the 30 MHz band.

My father is looking for a DOS program called "SuperMorse", or at least
that's what he thinks the name is. It's supposed to help you study the
morse code, generate test for the different license classes, etc.
Does anyone know where I can pull this off the internet, or where it can
be purchased, if it indeed does exist. thanks

Police, fire, rescue, commercial land mobile, government
agencies, ... Yeah, I'd guess "conflict" is possible. However,
it may be convertable to the RC channels in the 4 meter band.

ARLB041 ARRL Strategic plan

Strategic Plan for ARRL to be Developed

Members of the ARRL Board of Directors gathered in Savannah,
Georgia, on May 6 and 7 to begin developing a strategic plan to
guide the ARRL in preparing for the opportunities and challenges of
the twenty-first century. The ARRL Long Range Planning Committee
had recommended that because of the importance of strategic
planning, the effort should be initiated separate from the regular
business of a Board meeting. The process that was begun in Savannah
will be continued with the objective of completing a draft plan by
the end of 1994.

>From Tad Cook, KT7H
Seattle, WA May 6, 1994
To all radio amateurs

SB PROP ARL ARLP018
ARLP018 Propagation de KT7H

Conditions were fairly good until May 1, when the previously
predicted cycle of disturbances from a coronal hole began again.
Solar flux was down a bit relative to the previous week.

Poor conditions should continue until the middle of May, when
geomagnetic activity should finally quiet down again. Solar flux
will be rising until a peak around May 19 near 100. Flux should
decrease again, with disturbances returning by the end of the month
for another cycle of high K indices.

Sunspot Numbers from April 28 through May 4 were 35, 16, 38, 80, 75,
52 and 38, with a mean of 47.7. 10.7 cm flux was 77.3, 77.8, 74.9,
75.2, 75.9, 74.4 and 73.1, with a mean of 75.5.

The projection for this week is from Larsen Bay, Alaska, on Kodiak
Island, to New Zealand.

80 meters should be open from 0000 to 1500z, and 40 meters from
0630 to 1530. Check 30 meters from 0530 to 1600, and 20 meters
from 0430 to 0700. 17 meters should be open from 0300 to 0430,
and on same days as late as 0600. 10, 12 and 15 meters do not look
good at this time. All of this assumes that geomagnetic conditions
are not terribly stormy, which tends to create problems for
propagation in the higher latitudes.

According to the Communications Act of 1934, if life or property was at
stake, it was not illegal for you to use any radio communications equipment
at hand for emergency communications.

You did precisely the right thing.

First point: Even if the frequencies you ask about are not being
used, you'll be violating FCC rules using 35MHz for radio control
anywhere in the United States.

The 30-40MHz band is populated by all types of users, police,
fire departments, first aid, and other "land mobile" users.

Oh great. Somebody else who thinks that USING CAPS WILL DRIVE YOUR POINT
ACROSS better. Well, it doesn't make any difference, except that if you
do it again, you enter the privilaged few who enter my kill-file.

Now I'm not arguing that your point is invalid--I feel that the autopatch
should be taken advantage of whenever possible (assuming, of course, a
legitimate reason and the unavailability or difficulty in finding a land-line)
but we don't need bully-er's like you here. This is supposedly to be a
friendly forum, believe it or not, or do you want to form a newsgroup
alt.flame.brad.ward.for.having.his.own.opinion.and.advice?????
Gees!!! Why wouldn't someone not want to use an autopatch??? How would like
everybody in a 50 mile radius from the transmitter know that you're going
in to the doctor to treat um. . .impotence??? Just a case in point! If you
don't like his opinion or advice, fine; but you don't have to try to reduce
him to nothing, it'll backfire on you!!!!

> : What? You've never heard of a magic T?

And what do you think a duplexer/diplexer does differently? It operates as a multi-port isolating device with two (or more) tuned ports all connected in parallel to a common port where the antenna (typically) is connected. The electrons do not care whether the circuit L and C constants are lumped on a PC board or distributed along coaxial (or balanced) line segments.

>
> The vocabulary used by 2-way radio folks uses the word "duplexers"

>
> AL N1AL

The only difference between your definitions is the undefined term "wider-spaced" frequency bands. The land mobile industry makes no distinction at present between the two terms and they often use the same hardware interchangeably to provide either function or both simultaneously.

Back in the days when TV was emerging, the term "diplexer" applied to the filters combining the two Video and Audio transmitters onto a single transmission line (Dual Insert = DI-plex) and the "duplexer" was used to let a single radio operate DUPLEX (Tx and Rcv simultaneously) on the same antenna. Today a general term "antenna combining network" covers both applications without any artifical restrictions based on vowels or historical misunderstandings.

>> per annum.
>I'd be willing to pay $26 a year if it meant we would get decent service from
>the FCC, including vigorous enforcement against non-amateur use of ham bands.

You won't, the service we get from Industry Canada is being minimized and
only well documented cases will be handled (much as it is in the US). The
$26CAN/year (~$17US) is used to cover the beaurocracy to handle licensing IN A
TIMELY MANNER, the purchase of equipment to pinpoint the signals of violators,
the cost of all well documented cases of police action, administrators that try
their best to help the community in the role of an advisor and the salary of
the persons answering the phone listening to a bunch of crybabies ...

I think *long* before any licensing fee can add to the service you are
currently getting from the FCC must be covered by the fees (which they are not,
obviously). I think you may be surprised at just how expensive their operations
are and how much of a free ride you are getting, funded by general revenue ...
In other words, if you want enforcement, I believe you will need to pay on the
order of $50US/year ...

Ciao, 73 de VE6MGS/Mark -sk-

This is perhaps a question that has been answered in the past here on the net
if that's the case, sorry for asking again....

I am considering running my station at home with battery-backed power. I have
several sealed lead-acid batteries in the 20Ah range that could handle the load.
I also have a Astron 30a supply that currently handles the load (no pun intended).
I'm wondering what is the best way to connect both the batteries and the supply
so that the batteries receive the right charge current and also take over when
the power supply goes off. Can anyone point me to a article or FAQ along these
lines?

Thanks,
scurrie

Listen, this all started with the bogus "War on Drugs" back in the
70's and 80's under Nixon and Reagan. That gross compromise of our
freedom in the name of protecting us from our "Godless depravity"
set up the whole mechanism for:

The War on Assault Rifles
The War on Handgun Violence
The War on Scanners
The War on Criminal Encryption
The War on Internet Pornography
The War on Nicotine
The War on Health Insurance Companies
The War on Corporate Greed
The War on Parental Abuse
The War on Polluting Automobile Drivers

and on, and on, and on.

Give it up, man. The Conservatives created this monster. Were they
really so stupid to think that it wouldn't turn on them?

Jim, W5GYJ

I'm interested in getting opinions as to which of the four Kenwood
speaker-mics would would be best for use in a high noise environment.
Basically I'm going to be carrying my HT around an airport tarmac and
I want to know which speaker-mic would have the best audio output with
the volume turned up.

I would recommend a GOOD earmic for that environment. IMHO a bull horn on
the shoulder is not always enough on a flight line. The noise cancellation
of the ear piece will make it much easier to hear the radio. I made the
mistake of going for a cheap earmic, the problem is low audio out when I
transmit, I have since played with a better earmic that did not cost that
much more and had good results. Of course, you do look like you're talking
to yourself when you use one, but I do that anyway. :-)

I already own my assault radios: Icom-735 with 100khz-30Mhz xmit mod
and several Icom-W2A's with extended xmit mods for VHF and UHF.

And if that weren't enough, I own a Pro2006 with a clipped diode...

Too bad these are now illegal radios as of April 26th -- the date
of the assault radio ban.

Well, we still have strong cryptography. Get your copy
of PGP at berkeley.soda.edu /pub/cypherpunks before it
becomes assault data manipulation.

Hmmm ... maybe you disagree with the Brad's advice. Fine. Just disregard it.

> Whatever YOU answered, its WRONG. Thats because whatever I DECIDE to
> use it for I CAN use it for (within the law). Why should the law limit
> it to, essentially, anything but running a business on ham radio, and
> then an idiot like you come along and LIMIT IT FURTHER, to WHATEVER YOU
> FEEL is 'inappropriate'????????

Actually, whilst this might be what you feel would be appropriate guidelines
for autopatch use, it's you that's wrong - VERY WRONG. In fact, aside from
Part 97 regulations, autopatch use is (by definition) limited by what the
repeater trustee regards as 'appropriate'. Not me. Not you. Not Brad. See?

> We dont need bully channel-cops like you around. Go beat your kids
> into submission again and get the hell off this newsgroup. We already

Maybe Brad was beaten up by his local repeater trustee for fixing a dentist
appointment via autopatch, and that's why he offered such advice? Maybe Brad's
local repeater trustee is a propellor-head like yourself, who cannot accept
that people are allowed views and opinions, and who tried to deny Brad his
right to voice his opinions? Who are *you* to tell someone to leave the
newsgroup? I'd humbly suggest that, on the basis you don't like some or all
of what you see here, you either drop the newsgroup yourself, or learn to use

a 'kill' file. Either way, *MY* suggestion to *YOU* is - simmer down ...

> The economics of patches in areas where each call costs money dictates
> the use of the patch only when necessary... in areas where all local
> calls are free, IT DOESNT. So, USE THE PATCH WHENEVER YOU FEEL LIKE IT,
> HAMS.. Just stay within the LAW, not the holier-than-thou ideals of
> no-brain OLD FARTS like THIS GUY!!!!

Wrong. Very wrong. But I've said all that. What was in Brad's post that indicated to you that he was devoid of mental capacity and/or scenile? Oh. Maybe that was just another of your irrational assumptions ...

Hmm ...

May 10 - Annular Solar Eclipse, Visible from Mexico, USA, Canada
May 20 - Resurs Launch (Russian)
May 24-25 - Partial Lunar Eclipse
May 25 - DSPSE (Clementine), 4th Earth Flyby
May 27 - DSPSE (Clementine), Lunar Flyby

[Info via LU7AKC]

* WEBERSAT NEWS *
=================
WEBERSAT (WO-18) is broadcasting new pictures and light spectrometer data weekly. Software for the extraction, decoding, and display of spectrometer data, written by Bob (KB7KCL), is available on LO-19 (file #s 371a/3739), or directly from Weber State University. Monday UTC continues to be the day for the broadcast of the most recent spectrum, along with the week's WOD.

WeberWare 1.0, 1.2, 1.3, or a similar program is required for picture extraction, decoding, and display. WeberWare 1.3 is the current software version, and is available from Weber State University, AMSAT-NA, or AMSAT-UK. The most recent WeberSat double field image is number 10/14, which was taken of an as yet unidentified area of Northern Nigeria, Africa. The photo has very few clouds, and land features are clearly visible. Expect new photos sometime during the week of May 9th.

WO-18 is currently sending spacecraft solar array current whole orbit data (WOD). This is an excellent opportunity for a student, group, or class to use this data for spacecraft motion studies, or for studying the long term effects of the space environment on solar cell effeciency. WOD collection and broadcast will adhere to the following schedule:

1 May/Week1: Array currents, Ch# 26 27 28 29 2A 2B
8 May/Week2: Array currents, Ch# 26 27 28 29 2A 2B during 10-May-94 eclipse
15 May/Week3: BCR, 21 22 29 2F 33 36
22 May/Week4: Temperatures and impact detector, Ch# 14 2F 30 35 3B 40
29 May/Week1: Array currents, Ch# 26 27 28 29 2A 2B

* MICROSAT DESIGN AT STANFORD *
==========

Over the years a number of Stanford researchers have been involved in the design and operation of dozens of different kinds of space vehicles. But, beginning this year, the Aeronautics and Astronautics Department has initiated a new program that involves students in designing, constructing and controlling small, simple and inexpensive "microsatellites" that are launched into orbit.

On Thursday, April 21, two dozen engineering students involved in this program at Stanford University showed a mock-up of their first satellite design to a visiting Russian official, Yuri Plotnikov, professor of flight mechanics and control design at the Moscow Aviation Institute.

If the project goes as planned, a year from now the 2-foot-wide hexagonal satellite will hitch a ride on top of a Delta rocket along with a commercial satellite. Once it goes into orbit, the satellite will begin beaming back digital pictures of Earth and broadcasting its position and status over ham radio channels with a synthesized voice.

"The program has two major objectives," said Robert Twiggs, a visiting professor brought to Stanford from Weber State University in Utah to jump-start the new small satellite development laboratory. "First is to give graduate students in aero-astro and other departments practical, hands-on experience in designing and building something that can be launched into space in only a year on a very limited budget. Second is to provide faculty, students, space experimenters and industry with an opportunity to do inexpensive space experiments."

Plotnikov's interest stems from the fact that the Moscow Aviation Institute is a professional school with 15,000 students devoted to aerospace design. "The name is historical. Actually, we design anything that flies," he said. The institute currently has a joint satellite program with Utah State University. When asked whether something similar is likely with Stanford, he shrugs and replies, "It's all a matter of funding."

The students have nicknamed their design the Stanford (or Satellite) Quick Research Testbed, or SQUIRT. They hope that this could become a de facto standard for microsatellites, which are a growing phenomenon worldwide. Students at the University of Umea in Kirna, Sweden, are working on a parallel design. So far, about a dozen student-designed microsatellites have been built and launched.

The watchwords for these satellites are simple and inexpensive. So the Stanford design uses powerful magnets to keep the satellite aligned perpendicular to the Earth's magnetic field, rather than employing

complicated gyros and thrusters to control its position.

"Usually, the reason for a satellite is its payload. But we are doing things backward. Our purpose is to get the experience of designing the satellite, so what it carries is of secondary importance. However, we've tried to come up with a payload that will be interesting and worthwhile," said Christopher Kitts, a graduate student in mechanical engineering.

The payload the students have agreed upon is a digital camera, voice synthesizer and global positioning satellite system receiver. The GPS receiver will allow student controllers to determine the satellite's position. Simple photocells will determine when the camera is pointing toward the Earth. That will allow the Logitech digital camera to snap images of different parts of the globe that will be transmitted by radio to interested ham radio operators.

According to Kitts, participants hope that the pictures and synthesized messages from the satellite can be used in elementary schools, middle schools and high schools to help interest students in science.

Text item: Text_1

>But nevertheless it must be possible to use digital voice over
>a 10 kHz FM channel. Gerrit, PA3BYA.

It is entirely possible but why bother if one QSO still takes up one whole repeater? The problem with digital voice on existing repeaters is that it is not as good as NBFM yet. The strongest signal on a repeater input will capture the receiver shutting out weaker signals. Thus you only get one conversation possible at a time with digital voice, just like now. I have had 4800 bps digital voice running, but it is not as good as NBFM. And increasing the bps rate to get better voice reproduction just widens the bandwidth required to more than NBFM requires.

Presently, for the same fidelity over the same bandwidth, NBFM is better than digital voice. The problem is a lot worse on HF where we are limited by silly rules to 300 bps max.

Sounds like a bunch of elitists to me. This is not within the spirit of
amateur radio at all.
I'd say that such a club should be frowned upon by the amateur community
and not given any undeserved respect. 73

1823. use INTERNET for linked repeater?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-09 19:21:29 UTC
From: jrl2@crux1.cit.cornell.edu
Message-ID: <2qm2fp$47@tuba.cit.cornell.edu>
Source record: 267370

Hello,
What do people think about the legalities of using
the net to link a repeater system. Say I want to link a
set of repeaters that are seperated by a large distance
which would cost too much to link with normal means (vhf
or hf links). Say instead you had this setup.

repeater output -> computer -> internet -> computer -> repeater input

and vise versa.

I would invision using a set of macs run maven or something
along those lines with 2 HTs with the ptt hooked up a set
of cheap TNCs which would only hand the PTT with the microphones
of the HT hooked to the speakers of the computers.
This is just a thought experiment. Problems I would see would
be validating the data stream so that only authorized traffics
would be able to pass, maybe hand-filtering.

Setup like this.

Link only runs say an hour a day, someone babysits it with
a 5 second delay before what goes over the repeater goes out
, the babysitter si then able to kill the stream if problems
arise.

What do you think?

-Jeff Luszcz N2TIQ

1824. HAMFEST - WILMINGTON, NORTH CAROLINA

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-09 19:25:07 UTC
From: LEELM@VXC.OCIS.UNCWIL.EDU
Message-ID: <01HC51XDFK2E90MWJN@VXC.OCIS.UNCWIL.EDU>
Source record: 267376

HAMFEST - WILMINGTON, NC

The 2nd Annual Wilmington Hamfest (Seafest) will be on Saturday, June 4 from 9am - 3pm in Trask Coliseum on the campus of the University of North Carolina at Wilmington. The coliseum is located at 601 South College Road (Hwy #132) which is at the end of Interstate 40. This is an ARRL sanctioned hamfest and is sponsored by the Azalea Coast Amateur Radio Club.

Talk-in will be on the 147.180 repeater.

Tickets are $5 at the door and $4 by preregistration. Tables for commercial dealers and the flea market are $6 each and chairs are $1 each. Electrical hookups (120 volt AC) are $5 each and will be for commercial dealers only. No tail-gate section. All activities will be inside. Preregistration must be received by May 18th and should include a S.A.S.E. and a check payable to the Azalea Coast A.R.C. and sent to the Azalea Coast A.R.C., P.O. Box 4044, Wilmington, N.C. 28406

VEC Exams for all classes will be at UNC-Wilmington in Morton Hall (Room 209) Registration will begin at 10:00 am. Walk-in only with NO pre-registration. The cost will be $5.75. Please bring your original license and a copy, and a picture ID to the exams. Also bring your original and a copy of any CSCE, if appropriate. Directions to the testing area will be posted and announced at the SEAFEST. Contact: Mr. Sam Franklin (KB4IL) 4026 Chapra Drive, Wilmington, NC 28412.

On-site food will be available.

Air conditioned facilities - Ample free parking area - Handicap access - Many commercial dealers - Inside flea market - Prizes - VEC testing - Special interest programs - Great restaurants - Lots of nearby shops - Battleship USS North Carolina - Fort Fisher Aquarium and Museum - Riverboat cruises - Historic sights - Horse drawn carriage rides - Nearby Wrightsville and Carolina beaches -

This Hamfest is in an area the whole family can enjoy.

For more information, you may contact:
Azalea Coast Amateur Radio Club, P.O. Box 4044, Wilmington, N.C. 28406
or the Seafest Chairman:
Mr. Buddy Boone (N4CTJ) 117 Springdale Drive, Wilmington, NC 28405
phone: 910-371-4595 (days) or 910-799-8693 (nights).

1825. Anyone used/designed a linear transponder for terrestrial?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-09 19:25:59 UTC
From: dgf@netcom.com
Message-ID: <dgfCpJvBB.87p@netcom.com>
Source record: 267374

Has anyone here ever used, designed, built or operated a linear transponder for terrestrial ham radio use? The kind of thing I'm referring to would work like a VHF/UHF repeater, but rather than demodulate/retransmit an FM signal, it would convert a narrow range of frequencies linearly, so you could "repeat" any mode (SSB, CW mainly) within the designated passband. I thought one was/is in operation in 6-land somewhere, but I couldn't turn anything up in a repeater directory.

No way. Sure, it's wet enough for good grounding, but the treeline is
too high to put up a decent antenna system. I think I'll stay nude right
here, thank you very much.

With Mr. May's thought in mind about memberships, I'm going to
renew mine A.S.A.P. to help get Luck back.

I think some of the board members' numbers are coming up.
Time for a RECALL vote or something.

This story reminds me back when I first became a Ham.
But the only difference is that I had only had my License in about 1 week
using a borrowed HT from a Fellow ham (both of us belong to the Local Rescue
Squad). I was out for a walk with my Landlords wife and daughter talking
to whom ever we went back to their house and was setting on the porch
when another Ham mobile started calling for help reporting a very severe
auto accident on I-64 just 5 miles west of my home. With me being a
E-911 dispatcher anyway the call was handled professionaly but I still
was shaken up over the entire mess. We had a major rock slide
and a loaded tractor trailer colided with the rocks and Ky State Police
Officer hit both the rocks and the truck both drivers were very seriously
injured and are now back to work.

Licensed or not, if the call for help you make over the airwaves
makes a better chance for someone to live in a life threatening situation
I'll be damn if I'm going to say something bad about it. You might be
reporting the accident that My Family or myself is involved in..

Having someone babysit seems more than a little bit like overkill.
It is absolutely trivial to confirm the source IP address of
an internet connection and drop connections made from unauthorized
locations. Bypassing this simple level of security is sufficiently
difficult that I don't think you would really have to worry about it.

Laurel, MD, in the middle of the Washington-Baltimore metropolitan
area is far from rural but its rescue squad still uses 33.020 MHz.
And it has to have PL since it shares the channel with Fairfax
Public Works across the Potomac.

The more general answer is that the 30-50MHz range is the
"low-band" land mobile radio (LMR) band. It is used by fire,
rescue, police, construction, power companies, etc...

From: "Kenneth M. Gianino" <gianino@sbctri.sbc.com>
Message-ID: <2qm6pl$9j7@sbctri.sbc.com>
Source record: 267229

Is there a good, UHF only HT out there that can be modified to transmit and receive up to 470MHz? I don't mind retuning and losing the part or all of the 70cm band. I've checked the mods servers and there seems to be very little interest in the UHF siblings of the current crop of 2m HT's. I'm not interested in dual band units. Anyone out there experienced with the Yaesu FT-73? I need an easily tunable unit for testing UHF GMRS repeaters and I am aware of the type acceptance problems if used on the air. I'm also aware of the type accepted units on the market that are very expensive and awkward to program. Any information would be appreciated. Thanks in advance.

: lose 25% in 2-3 days. From what I've seen and had confirmed, they suffer
: a 20% or so leakage of charge in the first couple of days, then they
: self-discharge like NiCds, and are useless after 30 days.

My direct experience suggests that leakage may be even worse than Ken describes. I use a pair of NiMHs in my Toshiba T4500C laptop. The performance has been extremely disappointing. While they do charge rapidly, they discharge almost as rapidly. Noticable discharge happens within hours, and almost complete discharge in days. Keeping your second "spare" battery going with a reasonable charge is almost impossible. Given standard usage for an HT, I'll stick with NiCads for the time being thanks.

>-Ken WB0QNA gianino@sbctri.sbc.com

I don't know about the FT-73, but the Yaesu FT-41 with the appropriate
mods will transmit up to 470 Mhz. The mod itself is for MARS/CAP and
specified a 420-460 MHz range, but I have tested the unit to 470 MHz on
the analyzer here at work, and it seems to work. Variations in the VCO
from unit to unit may make it somewhat flaky out at 470 MHz. Very
small unit, low voltage amplifier. Not a lot of RF output with the
standard battery pack.

Of course, I don't guarantee that your unit (if you choose to buy one
and mod it) will work to 470 MHz. Your mileage may vary. Oh, and you'll
have to get the mods from someone other than me -- I hate to be this
way, but since you have freely admitted that you would be doing something
illegal, I won't help you -- call me tighta**ed, but blame the trial
lawyers.

Yes, type accepted units are hard to program. That is a requirement
of type acceptance -- make it hard for the user to go somewhere he/she
isn't supposed to go.

-Ken

SB RAC @ CANADA < VA3RAC $RAC_9405.09
RAC SPECIAL NEWS BULLETIN INTERNET EDITION - 9 MAY 1994
Issued at RAC Administrative Office
P.O. Box 356
Kingston, ON, K7L 4W2
Editor: Cam Inglis <INGLISC@GTM-INC.COM>
Internet Editor/Transmission: Steve Cutway VE3GRS <CUTWAYS@QUCDN.QUEENSU.CA>

CANATEX 2

Industry Canada's Telecommunications Controller, Joe MacPherson, has requested that RAC put out the following as a Special News Bulletin. The cooperation of all Canadian Amateurs is appreciated. Packet BBS SysOps are asked to pay particular attention.

As many amateurs will already know, a major NATIONAL LEVEL exercise called CANATEX 2 is under way. The exercise began on May 2nd and will end on May 13th, 1994. The exercise is based upon a catastrophic earthquake scenario in the area of the Lower Mainland of British Columbia. Involved in the exercise are many municipal governments in BC, the governments of British Columbia and Alberta and the Federal government. In addition, several other non-government agencies, such as the Canadian Red Cross, are involved.

As part of the tests of telecommunications, which are organized and controlled by Industry Canada (Telecommunications), amateur radio operators are being asked to transmit realistic messages to and from various locations across Canada. While these messages may seem to be COMMERCIAL in nature, they are, in fact, part of the exercise.

Section 51. of the General Radio Regulations, Part II reads as follows:

"In a real or simulated emergency, the operator of an
amateur station may communicate any message that
relates to the real or simulated emergency on behalf
of any person, government or relief organization".

An unfortunate incident occurred recently whereby an amateur radio operator refused to relay one of these messages on the basis that the content was COMMERCIAL in nature. It would seem that the operator in question was not familiar with the General Radio Regulations.

Since every effort is being made during CANATEX 2 to demonstrate the value of AMATEUR RADIO in disaster situations, it would be appreciated if the operators who are involved in the relay of these messages are given the support and cooperation of the rest of the amateur population.

From ARRL Headquarters
Newington CT May 9, 1994
To all radio amateurs

SB QST ARL ARLB042
ARLB042 It's law in New Hampshire

It's law in New Hampshire

New Hampshire House Bill 1380, recently signed into law by Governor Steve Merrill, exempts from real estate property taxes ''radio towers, antennas, and related or supporting structures used exclusively in the operation of an Amateur communications station under Federal Communications Commission Amateur Radio Service rules and regulations.''

ARRL Counsel Chris Imlay, N3AKD, called the bill ''an important precedent,'' saying that it may have far reaching effects throughout the US as amateurs continue to seek relief from local and state regulation.

ARRL New Hampshire Section Manager Al Shuman, N1FIK, who played a key role in the passage of the bill, largely credits ARRL New Hampshire State Government Liaison (and representative in the state legislature) Ralph Rosen, W1HSB, and a team of ARRL Field Organization volunteers, who testified numerous times before both House and Senate committees.

Poster 3 rebuts:
>So what? It's short, it's concise, and I like it too.

Excuse me? It's short and concise? I think not. "I've arrived" is
two syllables and "I'm destinated" is five.

Most seem to say "I'm destinated and going QRT." What's wrong with
"I've arrived and going off the air"? Jargon for the sake of jargon
is absolutely ridiculous. Jargon may be needed for precision but in
general, standard English is fine.

1843. RE: 2m J-Pole at 70cm

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-09 23:44:00 UTC
From: greg.pool@nitelog.com
Message-ID: <cb.17840.2099.0ND04E23@nitelog.com>
Source record: 267246

GG> I recently obtained by FTP the instructions for making a 2m
GG>J-Pole antenna from 300 ohm cable. It said that this ant should also work
GG>on 70 cm. Does anyone have experience doing this? or is it much better to
GG>make a J-Pole specially for 70 cm?

Yes it will, depending on the dimensions. We had Art Hoffman WA6TVN do
some tests on a common J-pole design and found it was resonant on 70 cm
but it's take-off angle is higher than the 2 m. You might want to tilt
it toward the station or repeater you talk to for better results.

>"legend," :-) but at least he seems to be quite legitimate now.

>My card went off yesterday.

I kind of have a scratchy throat today - how about everyone sending me a QSL card to save me the hassle of buying an HF rig.

Just kidding. I don't want any QSL cards, but I was always under the impression that we were supposed to communicate with a person over the air before sending a QSL card. Do they now double as Get-Well cards and Change-of-address cards??

Tell me where I said that *ALL* hams are radio addicts, and where did
you get this arguement about me complaing about how hams cause
interference or they got a 200ft tower. Sounds to me like someone is
generalizing about people who complain about hams.

Kettle, Pot, Black?

>
> Maybe a cross-post onto rec.radio.cb might be a good idea?
> Maybe thinking before typing may help???
>

You must be reading into my posts a bit too deep their bud..I'm not one
of them ham radio bashers. I'm currently in the process of studying a
bunch of books so I can hopefully take the test by the end of this
summer. But between work and school I hardly ever have free time to
really study them...and its one of those back burner things, that I
promise I'll do someday.

Unfortunately, I've been saying that since I was a freshmen in highschool
and I now am in college...but this summer things will be different.
<maybe>

As for radio addicts, I'm sure you know some in your area..I have a cb
in my car, and no matter what time of day I get in the car, their are
some people that are always on the air. These always on the air types
are the types I call radio addicts.

If I were to look at myself objectively I'd probably call myself a
computer addict (not to be associated with hacker <g>)

>
> GW0TJO
>
> zcapl34@ucl.ac.uk
>
> For the record. I have ALWAYS found CB'ers treating the bands with respect.
> That is more than you gave them wasn't it?
>

Well you get all kinds on the air, just like you get all kinds on the
net or on the street. Some hams, and some cb'ers abuse their privilage,
run higher wattage then they really need to or are leagally allowed to.
Others are extremely rude, and curse alot. Those are the minority, but
when your listening for the first time, it bad apples that form the
impression not the majority.

Or how about the next door neighboor who gets to hear your conversation
on their tv/sterio? They probably don't think about the millions of
conversations taking place everyday via radio, but when someone's
interference hits them when they are watching their favorite show, or
on the phone, they get ticked about the interference.

Take on radio examples, if you don't believe me. I know when I went to
London that we took the tube everywhere, so i don't know how much
driving experence you have, but in California most people go about
65-75mph on the freeway, when the legal speed limit is 55mph. So when
you get stuck behind someone going the legal limit you get annoyed
and make a quick generalization "Those damn
asians/elderly/foreigners/etc they drive too slow." You forget all about
the thousand or so other asians/elderly/foreigners that were going 65.

As for your flame to my post, I was suggesting since she apparently
posted this request about 4 times she wasn't having too much luck
on the net. And to try other venues of getting volunteers. If she had
to hit up the 10meter or even cb and get some of the local people
to help. Since post people on the net live pretty far from Aptos CA.

Then again, remembering the days when I lived in Aptos, there was
next to nobody who had a computer, and most of my street was empty
lots, a corn & brussel sprout farm

Actually, what I think you are talking about is an AXIP wormhole. This is in very common use today on ham radio's own TCP/IP network. Or, do I have your description of the question wrong?

MY COMPUTER -> TCP/IP STATION -> Internet -> TCP/IP STATION -> Destination

It's available from HAM-server. Send email to ham-server@grafex.sbay.org

In the text place:

get /hamradio/morse/sm410.zip

There are others available, as well. To get an index, add:

get /hamradio/index.txt

>Aloha+73 de Greg WH6DT
>
>---
> • OLX 2.1 TD • Darn cat...get off the keyb*$%#%&(&**%^&% NO CARRIER

I agree. After some thought on this matter, the above makes sense.
Consider that a J-pole is a 1/2 wave end fed antenna with a 1/4 wave
matching section. Addition of 1/2 wave sections doesn't do anything
from a driving point impedance (once around the Smith Chart)... So,
at 3x the frequency, the 2m J-pole becomes a 3/2 wave end fed antenna
with a 3/4 wave matching section. Remove the extra 1/2 wave multiples
and it should exhibit the same impedance.

Alas, there is a problem. Consider the 3/2 wave radiating portion. It
is really 3 stacked 1/2 wave units. Many omni-gain units use stacked
dipoles to squash the pattern to the horizon. However, what's missing
in the J-pole is the phase reversing elements. The three dipoles are
stuck end to end -- that is, the middle 1/2 wave section is opposite
in polarity to the end sections. This results in gross cancellation
of the pattern towards the horizon. Directly along the antenna (pointing
up), the patterns all add constructively and form the main lobe. Another
way to look at this is that the antenna begins to approximate a longwire,
which has its main lobe along the axis of the wire.

So, I've come to the conclusion that although it loads up fine and presents
a proper impedance, a 2m J-pole at 440 MHz puts the energy in the wrong place,
unless you are working birds :-)

Now, if you put phasing coils (ala cell phone antennas) between the 1/2
wave sections, the thing could work REAL well. Been thinking about
this. Will report if I discover (or rather recreate) anything useful.

NOTE: The Effective Sunspot Number for 08 MAY 94 was 13.9.
The Full Kp Indices for 08 MAY 94 are: 5- 5o 6o 5- 4- 3+ 4- 4o
The 3-Hr Ap Indices for 08 MAY 94 are: 38 50 78 41 22 19 25 29
Greater than 2 MeV Electron Fluence for 09 MAY is: 2.2E+09

SYNOPSIS OF ACTIVITY

Solar activity was very low. No events were observed the
past 24 hours. Region 7719 (S06W01), the only spotted region
on the disk, is in slow decay.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field has been at unsettled to major storm
levels for the past 24 hours. The GT 2 MeV electron flux
remained very high.

Geophysical activity forecast: the geomagnetic field is
expected to be mostly unsettled to active with periods of
local nighttime minor storm conditions expected.

Event probabilities 10 may-12 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 10 may-12 may

A. Middle Latitudes
Active 20/20/30
Minor Storm 35/35/20
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/25
Minor Storm 40/40/35
Major-Severe Storm 10/10/05

HF propagation conditions were below-normal over most
regions today, particularly high-latitude southern-hemisphere
night-sector paths where occassional significant degradation
was reported with MUF depressions approaching 50% of normal.
Daytime conditions were not as heavily depressed. No
significant changes are foreseen for the next 48 to 72 hours.
A very gradual improvement is still expected, but will likely
be frequently intermixed with degraded periods.

Which brand of AA NiCads has the highest Ampere-hour rating? The highest I've been able to find so far is Radio Shack's 0.85 AH cells. Are there 1 AH cells out there or is 0.85 as good as it gets? Oh, and of course, cost is a factor too. Many thanks in advance. 73.

1853. FCC agents to get new equipment to find problem radio signals

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-10 06:26:42 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseCpKpwI.8I8@netcom.com>
Source record: 267259

copied from packet:

From: W7LD@VE7DIE
To: FCC@USA
Subject: NEW ELECTRONICS FOR FCC AGENTS

Here is an interesting Bulletin from the AP NEWS SERVICE:

The Federal Communications Commission on Friday, May 6th, 1994
showed off a car equipped with two computers, a color printer, complete
with a satellite receiver in the trunk. This car when driven through
cities and neighborhoods can detect unlicensd radiosignls and signals
that cause malicious interference.

By June, the FCC will have ten such cars, each installed with
$75,000.00 worth of electronic equipment. The Commission would not say
which field offices will get the first cars. The goal is to provide each
Field Office with at least two of these cars.

The FCC finds about two or three unauthorized radio signals a
month, with the worst offenders being "Low power FM radio stations, Taxi
cab dispatchers, Businesses, and especially Boat operators," said
Commission spokesman Steve Svab.

Inside each car is a Control Station between the driver and the
rear seats. It features a Mobile Phone, a Computer Keyboard, and Two
Small Screens: one for computer commands and one for the display of maps
and other information.

With this equipment, a FCC agent can pick up a radio signal and
use a Data Base to find out if it is authorized and pinpoint the location
of the transmitter. Furthermore, data can be trnsmitt from the car to
a central location and from one car to another. "Big Brother is listening
to us using new sofisticated toys! Be careful.

Retransmitted by:
Jack West W7LD
---
end copied file.

Looks like those micropower FMer's should think twice now. They'd probably
be better off leasing some time on a licensed station to get your agenda
out.

In article <2qln33$9jf@innsrv.sce.com> scurrie@vnet.ibm.com (Scott Currie N6ECN) writes:

I am considering running my station at home with battery-backed power.
I have several sealed lead-acid batteries in the 20Ah range that could
handle the load. I also have a Astron 30a supply that currently
handles the load (no pun intended). I'm wondering what is the best way
to connect both the batteries and the supply so that the batteries
receive the right charge current and also take over when the power
supply goes off. Can anyone point me to a article or FAQ along these
lines?

I run my station off a deep cycle RV battery that is kept fresh by a
trickle charger. This works well for receiving and low power
transmitting. When I run QRO, I switch in my Astron 20A supply.
The battery makes a great surge regulator. The household lights no
longer flash Morse code messages.

The setup:

The whole station is connected with 'standard' molex connectors
for easy assembly/disassembly/experimentation/reconfiguration.
All the loads (scanner, transcievers, lights, keyer, dvm...) and all
the sources (battery, trickle charger, power supply) are terminated
with the moles plugs and sockets.

The loads are connected to the battery and the battery is connected
to both the trickle charger and (via a heavy duty switch) the power
supply.

I thought long and hard about adding an automatic switcher but the
convenience would not have come close to offseting the complexity.
Diode isolation was ruled out for its forward voltage drop.

I'm glad I did it and the only thing I'd do different is to relocate
the battery to another room. It does produce a SMALL amount of
odor under some conditions. My new shack has been planned but not
yet executed. It will have the battery in a case with a vent to
the outdoors.

1857. 50 MHz opening in Europe

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-10 09:48:47 UTC
From: besten@faculty.chem.ruu.nl
Message-ID: <besten.768563327@faculty.chem.ruu.nl>
Source record: 267261

On the 9th of may the ZD8VHF beacon was heard via multi hop Es and surprisingly 5T5JC (IL30, Mauretania) was worked by PAoJMH, PA3BFM, PAoRDY, PAoHIP and PA3FYM. The first stations worked him during a 20 minute opening in SSB, the last station during a 1 minute opening an hour later in CW. Times: first opening 18.20 - 18.40 UTC, second opening was only one minute at 19.30 UTC. Signals were in the 55 - 57 range.

Prior to the multihop openings, Spanish stations could be worked with moderate signals.

Remco, PA3FYM

Was that last comment really needed? I really think that labeling a whole
group of band users is particularly irresponsible. Next time someone moans
about "Ham" activities and how they "always" have 200ft towers, and "always"
wipe out anyones chances of getting any form of TV signal. Please remember
your own bout of generalisation...

Maybe a cross-post onto rec.radio.cb might be a good idea?
Maybe thinking before typing may help???

GW0TJO

zcapl34@ucl.ac.uk

For the record. I have ALWAYS found CB'ers treating the bands with respect.
That is more than you gave them wasn't it?

My father is looking for a DOS program called "SuperMorse", or at least
that's what he thinks the name is. It's supposed to help you study the
morse code, generate test for the different license classes, etc.
Does anyone know where I can pull this off the internet, or where it can
be purchased, if it indeed does exist. thanks

1860. Re: MultiBand Quads-Which One?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-10 11:17:29 UTC
From: michaela@freenet2.scri.fsu.edu
Message-ID: <2qnqg9$4m5@freenet3.scri.fsu.edu>
Source record: 267265

My experience is solely with two-element quads, but do have a hard look at the GEM quad built (now) for over 20 years by a Canadian company (possibly in Alberta?). -- I found that pretty much "electronically" a quad is a quad is a quad (as to gain, front:back, etc.). "Construction-wise" was where things varied among manufacturers. In this regard, the GEM quad people have a lot to offer: their design always reminded me of snowshoe webbing, i.e., a lot of fiberglass bands and epoxy coating. They make a very strongly-built quad and have made this design for over 20 years (my first GEM quad was bought ~1970, for example).

The GEM people manufacture 2, 3 and 4-element quads. If I were you, I'd start with a 2-el version and "add on" later [you may find this is fully satisfactory for you]. Three and four-element quads are pretty awkward beasts to build, tune, maintain and so on. I had a good friend that had a 4-element GEM quad. The design (mid-70's) was somewhat compromised, i.e., the effective boom length was only around 25-ft or so [30-ft was optimal design in those days]. Thus, with shorter spacing between elements, the overall characteristics of this 4-element design was "down" somewhat [but, it still outperformed my 2-element version].

We routinely used Rohn tilt-over towers with our quads. They were ideal for building, tuning, repairing the antenna. We found fixed towers and crank-up towers less desirable when it came to managing quads.

Wind-wind-wind is the problem to guard against with any quad design. I'm currently using a tri-band yagi because it is a carry over from the QTH before last where the sustained winds were simply impossible for a quad design. That was in eastern Washington where the winds could below for 2-days at 45 mph nonstop [literally!] and peaks at 70-80 mph were common place. There were 400 licensees in that area and I only knew one guy who dared to use a quad there! -- I miss my quad: I liked its very fine F:B ratio, its appearance and simplicity. If I had one now, I would have strung it for 12M and 17M in a very simple, easy fashion. This would take one-hour's construction + some re-tuning {I suspect}. As it is, my tri-band yagi must be basically replaced [very costly] to pick up 12 & 17-meters. Even the new 5-band yagis are pretty much a compromise...etc., etc., hi. Pays your money; takes your choice, I guess. Have fun, you'll enjoy a quad. 73,

Michael Christie, K7RLS/4

The following is a QST

From ham radios greatest show on earth, the 1994 Dayton Hamvention, this is Newsline. This weeks top story is the Hamvention itself. Newsline has several reporters here on the scene.

(*****
10 WPM CW PROPOSED

The biggest news out of Dayton involves a plan being hatched by amateur radio equipment manufacturers and magazine publishers. They want easier licensing requirements for access to HF spectrum. Amateur Radio Industry Group members say the 13 word per minute Morse Code requirement for HF access should be lowered to 10 words a minute and they plan to work toward that goal. At their April 28th meeting, group members discussed the plan, including petitioning the Federal Communications Commission. Giving advice to the group is former FCC official Ray Kowalski. He tells group members the timing for such a move is excellent, since Washington's political climate is so heavily geared toward

emerging technologies.

"What's good for amateur radio is good for America. This is where the technicians and the bright young minds get their start. This is the fertile ground where they are planted. And if we don't nurture that and keep it growing and going, comes the next time we need engineers maybe we will rent them from Taiwan or some place, we will not have them home grown." Ray Kowalski, former FCC official.

The hottest selling ham gear lately has been VHF and UHF equipment. That reflects the strong growth in codeless technician class hams.
But equipment manufacturers are frustrated by marginal profits from sales of big ticket HF items. Some manufacturers say current code requirements act as a barrier to hams who would otherwise populate the HF bands. Ray Kowalski, currently a Washington lawyer dealing in communications issues, tells group members they should act on their wishes before the year is out.

"There is a window of opportunity that is now open. In Washington, when a new administration comes in, it takes them a year to get their act together, and by the fourth year they are hunkering down for the election. They don't want to do anything that will make anybody mad. So there is that two year window of opportunity in any administration where everything gets done. We are in that window now. So this is a great time to be thinking about what changes are necessary and natural for this service, this hobby, what ever you want to call it." Ray Kowalski, former FCC official.

One of those attending the amateur group meeting is Yaesu USA's Kevin Karamanos, WD6DIH.

"I think in the long term the industry is going to try to get together and promote the technician to move up to general class and hopefully populate the HF bands. We need to do what ever we can to get more folks up there and move up." Kevin Karamanos, WD6DIH, Yaesu USA.

(*****
THE RAINS CAME

The hottest selling product at this year's Hamvention '94 just may have been the 2 dollar poncho. The skies opened up over Hara Arena, dumping nearly an inch and a half of rain on tens of thousands of hams. The plastic sheets covering acres of flea market spaces soon carried small rivers of water.
Some flea market vendors say the torrents of water killed their business.

"It's wet and it's cold today. Yesterday it was at least warmish rain. This one is not nearly as much fun."

"If it'd quit rainin', it'd be nice."
"Has the rain hurt you?"
"Yes it has."

A flea market vendor from St. Joseph Missouri knows that lousy weather is a Hamvention tradition.

"It's bad weather. We have had bad weather for the fourth year in a row now. It's defiantly the biggest and the best ham convention that there is in the United States or in the world but the weather has not cooperated. The gods are not favoring us right now."

But enthusiasm still manages to run high. The Hamvention is, after all, one of the world's ultimate trips down the electronic information superhighway. As Tracy Douglas from Akron, Ohio, learns, the Hamvention means money.

"I'm a retired computer scientist that did fifteen years of computer work. And I became a ham radio operator last year. this is my first time selling at the Dayton Hamvention. I do repairs on all types of computers and peripherals. I had five dealers come in here and wipe out a hundred and six hard drives. I grossed over five thousand dollars in an hour."

Money changes hands inside Hara Arena, too. With thousands of flea market shoppers forced inside by the rain -- and the thousands of people already there crowds are 15 deep at some booths. Huge masses of people move along at a snail's pace. "There are so many people and so little space!" Yaesu USA's Kevin Karamanos.

Despite the weather, Hamvention '94 draws widespread praise. It's an opportunity to learn, spend and socialize. Hamvention '94 is quickly drawing to a close. Regardless of the weather, everyone we have spoken with says that this years Dayton Hamvention will be a show that will be very hard to beat. More on Hamvention '94 in future reports.

(*****
UNLICENSED BROADCASTER LOOSES COURT CHALLENGE TO FCC BAN

In other news, a protest to the Federal Communications Commission's ban on so called low power micro broadcasters has been dismissed by a San Francisco federal appeals court. That court says the case belongs in a lower court first.
The FCC's refusal to license radio stations less than 100 watts is being challenged by William Dougan of Phoenix, Arizona. Dougan's half-watt transmitter was shut down by the commission back in 1992.
Dougan's lawyer said his client broadcast for about a month to the 600 residents of his mobile home park before the FCC ordered him to stop. Dougan was also fined $17,500.
In his filing to the court, Dougan argued that the ban on

low power radio stations is unneeded for orderly regulation of broadcasting. He also claimed that it violates his freedom of expression and reserves the airwaves for the wealthy. But the FCC responded by saying it was acting within its legal authority to apportion the limited number of frequencies available.
Without discussing those arguments, the 9th U.S. Circuit Court of Appeals on Wednesday April 20th said suits challenging FCC forfeitures, such as Dougan's fine, can be filed only in a U.S. District Court. The District Court ruling can then be appealed back to the 9th Circuit.
Dougan filed his suit in the appeals court, which directly reviews rulings by a number of federal agencies. But the court, in a 3 to 0 ruling by Judge Cecil Poole, said it had no jurisdiction in the case.

(*****
FCC URGED TO RAISE FINES ON INDECENT BROADCASTS

In the nations capitol members od Congress are telling the Federal Communications Commission that it should impose higher fines on broadcasters who use indecent language on the air.
The FCC has already fined shock jock Howard Stern and the company that broadcasts his programs over $1 million for using indecent language in his programs. Stern and the company are appealing the fines, saying they violate free speech protection.
But FCC Chairman Reed Hundt is saying that even if higher monetary forfeitures are mandated, the commission lacks the resources to handle all its responsibilities. Hundt told a House of Representatives Appropriations subcommittee hearing on Monday April 18 that a staff shortage was hindering efforts to handle license and merger applications and to increase competition in telecommunications and cable TV. Hunt added that FCC resources are not sufficient to achieve the agency's goals. He would like another 200 full time staff to join the 2,050 now on staff. The Office of Management and Budget must approve any such staffing request.

(*****
KY1T FIRED BY ARRL

Another story making news here at Hamvention '94 is the firing two weeks ago of Luck Hurder, KY1T, Deputy Manager for the ARRL's Field Services Department. No specific details of the circumstances leading up to Hurder's dismissal been made public by the American Radio Relay League. The unofficial word on the convention floor is that his firing was over a directive by his superiors at headquarters for Hurder to first consult with them before posting information or responses on various public bulletin board and Electronic Mail systems he was assigned to operate for the League.
In his last year of service in Newington, Hurder devoted a

considerable amount of time answering questions on various commercial e-mail systems like Genie, Prodigy and America Online. He even serves as the assistant SySop on the America Online ham radio board in addition to having been the operations director of the ARRL's own public access board.
No successor has yet been named to replace KY1T.

(*****
900 MHz PAGING

The FCC has released the text of a rule making order that grants channel exclusivity to several classifications of 930 MHz paging systems. Under the new rules, paging system licensees may qualify for channel exclusivity by constructing systems consisting of a specified minimum number of channels. There are three sub categories that fall under the new rules. These are local, regional and national.
The commission says that it intends to protect qualified local and regional applicants from interference by applying minimum separation standards of co-channel national systems. It will also act to prevent the hoarding of frequencies by limiting applicants to one exclusive frequency assignment at a time.

(*****
DL HACKER

On the international scene, word that German police have cracked down on a nationwide ring of computer hackers who found a way to telephone around the world without being billed. The regional criminal office in Munich said U.S. telephone companies alone had suffered millions of dollars in lost revenue because the ring had used computers to tap into networks illegally and make phone calls.
In a coordinated search, police raided the homes of about 60 suspected hackers all over Germany. Some were identified as being ham radio enthusiasts, though no call signs were given.

(*****
HUNGARIAN TV

Commercial TV may be just around the corner in Hungary -- if the political and legislative embargo that has kept the broadcast sector hamstrung since 1989 finally comes to an end. Executives at the long suffering TV Channel 3, a Budapest regional station with a license but no frequency to broadcast, has yet to receive word as to when a frequency will be allocated. Up until now, Hungary's private TV and radio industry has been stymied by a ban, imposed by parliament in 1989, on the issuance of broadcast licenses. Parliament has vowed not to lift this nationwide ban until the government formulates acceptable post communist legislation regulating the nation's electronic media sector -- something Hungary's ruling coalition has yet to do after four

years in power. Parliament did agree last year to partially lift this moratorium and permit the establishment of private radio and TV stations in local and regional markets. It was during this period that Channel 3 received official sanction to begin broadcasting in Budapest.

(*****
DX

In DX, look for Saint Marten on the air from May 24th to 30th. VP2ML, and AH0W will be signing PJ7/WB2CHO and PJ7/OH2LVG respectively. They will also team up to operate in the CQ WPX CW Contest as PJ8X. QSL PJ7 via K1RH.

(*****
RAFFERTY MEMORIAL

Closer to home, word that the memorial fund raising by the Northern California DX Foundation for Jim Rafferty, N6RJ, who died in June of 1993 raised nearly $8,000 from 125 individuals and organizations. The donors' call signs or organizational names were inscribed on a plaque presented to Jim's widow, Shirley Rafferty. The plaque will eventually be displayed at the Anaheim, California Ham Radio Outlet store where the Jim worked.

(*****
RCA TO THOMPSON

Finally, do any of you know the name of the dog listening to the phonograph in the old RCA Logo? We will have that piece of information in a moment. But first this related story about a well known midwest radio club has decided to change its name to reflect the corporate image of the company that it is allied to. The RCA Radio Club of Indianapolis, Indiana has been re-named the Thompson Amateur Radio Club for two reasons. First, it is the French owned Thompson that actually manufactures RCA brand label consumer products in North America. Even more important is the fact that the General Electric Company owns the rights to both the RCA name and the well known RCA dog and phonograph logo which for a long time have adorned the masthead of the club newsletter. Some club members were reportedly concerned over the possibility of legal action by General Electric. As far as we can determine GE never said a word but rather that take a chance the RCA name was dropped and replaced by Thompson.
And oh yes. The name of the dog in the old RCA logo was Nipper.

(*****

For this week, that is all from the Amateur Radio Newsline. You can write to us at Post Office Box 463 in Pasadena, CA 91102.

[1] VHF Transceivers for sale or swap.
Date: Sun May 01: 22:46:21 MST.
From: Frederick Franz (WA6VHB)
Lines: 34
Distribution: USA

I have for sale or trade two VHF mobile transceivers.

(#1) Icom-230, PLL, synthesized, 67 channels, 146 to 148 Mhz. This unit covers the bandwidth in 30 khz increments. This is the original band plan for 2 meter repeaters. E.g., 146.76; 146.79; 146.94, etc. The repeater offsets are -600 and +600khz. The radio also operates on any of the simplex frequencies, e.g.146.52; 146.55; 146.58 etc. The power output is 10 W. This unit features an analog type S meter. The radio does not have DTMF or PL (CTCSS), however there is a an accessory connector for 9V. power take-off and audio input. (I have used this for external DTMF and it works fine). The unit also has a jack for external speaker. Price is $100.00 OBO. (See swap info below).

(#2) Icom-280, PLL, synthesized, 559 channels. 143.9-145.995 Mhz in 5 khz steps. 146.01-148.11 Mhz in 15 khz steps. This is a later version than the Icom-230 for an expanded 2 meter band plan. The repeater offsets are -600 and +600 and the radio operates simplex on any of the channels. This radio has a dual power output selection of 10 watts or 1 watt. The frequency display is a 4 digit bright red LED type. This radio also has an analog type S meter, and a jack for an external speaker. Also featured is a 3 channel programmable memory. No DTMF or CTCSS. Price is $160.00 OBO. (See swap info below).

Both of the above mobile units come in factory boxes with manuals and accessories: mounting bracket; power cord; extra fuse; and hdwe. These radios are in good condition and I'll even pay the shipping!

I'll trade both of the above radios for a used dual band VHF/UHF radio such as the Alinco DR570T, DR592T or DR600T. (DR570T or DR600T preferable). Or if anyone has dual bander and doesn't want to trade, I'll offer cash. (The amount depending on condition, and if manual and accessories are furnished).

Please contact: Frederick Franz (WA6VHB)
1204 N. Ponderosa Circle
Payson, AZ 85541-3843

1864. Willful Interference

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-10 13:09:44 UTC
From: mmjjmm@post.its.mcw.edu
Message-ID: <2qo12o$5n4@post.its.mcw.edu>
Source record: 267267

In my community one of the local repeaters has been plagued by an individual or individuals who is causing willful interference with others by constantly kerchuncking the repeater and also using DTMF tones when others are on the air. This appears to be a willful attempt to disrupt communications. I am looking for any insights that people may have regarding the psychopathology of people who engage in this behavior. Any insights or experience that people on the net have had with these individuals would be most welcome. When people have been caught were they well known and what was the motivation. Your input may help us stop this illegal operation.

1865. Help:Bootleggers in area

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-10 13:14:04 UTC
From: gregg@plains.nodak.edu
Message-ID: <gregg.274.2DCF889C@plains.nodak.edu>
Source record: 267273

I'd like to post this to see what you all out there in radio/net-land think and see if anyone has any ideas about what to do.

In my home town, where my Dad and Mom, both hams live there is a group of bootleggers using 148.00Mhz. It started with one No-coder who must have thought it was fun to talk on fm. He told his cb'er friends about it. They started to buy rigs too. Now there is around 10 to 15 people, guys, wives, little kids, all hanging out on 148.00. They yak away, never identifying, because only one of them has a license. They cuss and swear and joke about getting away with talking without a license. Every now and then one of them makes a mistake and transmits on the local repeater for one transmission, then quickly moves back to 148.00 to talk to his/her buddies.

The local hams have contacted the FCC field office for the area many many times. At first the engineer in charge said he couldn't do anything about it at all, he was too busy and understaffed and underbudgeted. After many more calls and complaints, he actually drove out to the community and listened in. Yep, they were there, doing just what the locals said, alright. Too bad. In fact, the engineer told the locals that they better be careful, these people might retaliate on the local hams for turning them in. The League has been asked for help, the Official Observer people have been informed, but so far, nothing has been done. The local hams have tape recordings by the dozen, they know exacly who these people are, where they live, where they work, the few who actually do work, etc. Still, the FCC nor the League will or can do anything about it.

Now, I ask you, if these people can do this with impunity, why the heck should the rest of us EVER worry about iding on time, or saying a cuss word now and then, or even bother getting a license at all.

Oh yeah, I forgot, one of them is using a call that is assigned to a guy who lives in St. Louis, which is a long way from here and he ain't the guy from St. Louis.

This whole thing makes me sick, and my folks and the rest of the ham community in the area are really ticked. Wouldn't you be, too?

Now, what should they/we do about this situation. Does anyone have any kind of connection with the FCC? Is there anyone out there who gives a damn?

Help!

John,
Does my HF receiver have the required bandwidth for this use when operating in the FM mode? At present I have a APT system but, I don't like the fact that with the NOAA birds, you can'nt frame loop the images. Does my HF recv. have to have the same wide bandwith as used for APT?
You said that their were other signal to be heard with this HF/TVRO combination. When you tune the ASC, whats out there...?
Have you used this HF/TVRO yourself? I do not have a TVRO system, however I have been thinking about buying one for some time now. Any suggestions on what type of TVRO system I should get?

How the weather in Canada?
William.

These are *NOT* illegal radios. The only thing that's illegal is tuning in to
some of the frequencies these radios are capable of receiving.

If our area is any indication, not much can be done with this guy. Several people have DF'd right to the source, a couple of people have obtained positive identification via spectrum analysis and guess what... local OO's will NOT write up a pink-slip. Then at the radio club meeting the issue was poo-poo'ed and bitched about. One thing for sure, this particular club is so steeped in red-tape it's not funny.

I had a question about these vehicles, if anyone knows more details.
About a year and a half or two years ago when I still lived in
Maryland, I parked next to a car in the Montgomery Village mall out in
Gaithersburg, MD, that was heavily loaded with this kind of
electronics. The car was pretty nondescript---some kind of
sub-compact Fiesta-like car, but between the driver's and passenger's
seats was a support containing a stack of equipment---I think two
video monitors, radios, etc. The thing that attracted my attention to
the car was that they had left a communications radio on and it was
blaring out.

Gaithersburg is pretty close to DC. The question I have is if anyone
knows whether the FCC was prototyping these cars and if so if the car
I saw was related somehow to this.

Thanks.

LE>-->>rated them based on field strength measurements. The outbacker was
LE>-->>dead last and the bugcatcher first - with a factor of 50 or so. That is
LE>-->>17db!

LE>Regarding the bugcatchers, there are a few varieties it seems.
LE>Any differences between the style with the capacitance hat
LE>and the style without? Also, the dude from Texas Antennas (?)

The capacity hat raises the feed point impedance somewhat. The Hustler
is something like 4 ohms at resonance on 75 I think...the carolina
bugcatcher (looks like a hamstick with a coil in the middle) is
something like 11 ohms at resonance on 75, while the Texas bugcatcher is
like 38 ohms at resonance on 75 meters. This isn't exact as it is from
memory, but the gist is the same...

The capacity hat also loads the antenna more effeciently than a loading
coil, and reduces the amount of inductive loading required.

LE>at Dayton pointed out that their model with the little coil at the
LE>bottom (besides the monster coil in the middle), allowed a much
LE>larger 2:1 swr range on 80 (and 40?). Any experiences?

Hmmmm....haven't seen that version. The Texas bugcatcher has always had
the bast reports from everyone I've heard when on 40 and 75 meters...but
for 20/15/10/6, the hamsticks have my vote :-). 73 de WB4IUY

I have always dreamed of a global radio propagation prediction display mapping software program/package, ideally for the maximum usable frequency (MUF) and lowest usable frequency (LUF), with stepped values in between.

I have used a simple propagation prediction program for about the last 10 years, and have experienced some limitations. I notice the methods of simple graphical displays have not changed much over those 10 years, and probably for many years previous. Each consists of a frequency versus time plot, with MUF and LUF frequencies displayed for each hour of the day (over a 24-hour period).

The global display would appear very similar to a worldwide weather map, or a barometric pressure map, or a relative humidity map, or a topographic altitude (relief) map - as each typically consists of semi-random squiggly lines with each line representing a particular value. Colour, line texture and shading are likely visual attractions, and of course the greyline.

In my understanding, propagation predictions are usually limited to a single signal path - one transmitter site and one receiving site, both in geographic co-ordinates. A number of simple prediction plots are often computed and plotted for various periodicals. They are great, and I notice they vary in detail. However they are static, assume mean (or by other predictive means) solar flux or sunspot number and it's sometimes difficult to find a region that's close enough to the location you want to work with. Sometimes you want to look at many regions in one effort - easy when you're looking at separate 2-D plots. What is needed is overlays - like what navigators use on their ocean maps. The more information the eye can take in the better.

A global propagation prediction map display, ideally on a computer, would make use of the latest solar flux (or sunspot number) value, possibly the various popular indices such as the A index and K index. A general relief map for global propagation at that time (ie realtime clock) would be displayed by default. The user should be able to select a transmitter location and, if the user's geographic location is entered/stored, a specific plot for that signal path (ie the short and long paths) would be displayed. A number of different displays would be possible, either merged onto the same map or the

map cleared and refreshed with a selected plot. Different frequencies (eg mid band for each band) can be computed globally and displayed. This sort of display would be useful on DXpeditions (except for the computer rf noise/hash :-).

The graphical front-end could be built around an existing propagation prediction program/algorithm. Like building a laboratory robot - build the electronic and mechanic internals first, take off the shelf whatever pre-built technology you can, and then build the front-end body over all that. Rather than writing the front-end first and encounting difficulties with breaks in the algorithm. The global graphical display lines would be incremented geographic co-ordinates, along a given path or in a surface grid. For an incremented frequency plot, a grid scheme would be employed, in this case displaying everywhere over the surface where that frequency propagates. (Think of those barometric pressures lines). None of this should have to require a supercomputer or a specialised work station, ie make use of any standard microcomputer resource for porting of source code to all platforms.

For more advanced programming, the various ionosphere layers, the troposphere (for VHF propagation), and any other atmospheric layers that may be involved, could be displayed also. Surface shading could represent one atmospheric condition or another (eg tropospheric ducting). This would no doubt require a lot more computing time and/or power/hardware. Some of the theory/algorithms to be used may not already imbedded in the original algorithm adapted, so the atmosphere events plots would require some further algorithms.

I got my BASIC algorithm from Radio Netherlands. Radio Sweden International's Sweden Calling DXers department put out a DXers Guide to Computing booklet which may be worth checking ou

I expect the global display, whether it be in 3-D spherical or in Mercator projection form, would bring about a number of technical problems. But if achievable, and nonetheless worth the experimenting with, it might be applied in many scientific field, and hopefully win you an innovative award or two!

The whole idea probably sounds absurd. :-)
But do have a think about it.

Ironically, in terms of the Sun, I have been writing this response while that annular eclipse of the Sun has been occurring in the U.S. It is an ungodly time of the morning here in New Zealand (after 4am). I've been watching it on CNN.

Good luck if you decide to go ahead with something like this.

Best regards,

QRZ will have more shareware and related information files.

Buckmaster has quite a bit more DATABASE information (US/International Callbook .. FM/AM/TV Commerical Freq Info)

So it depends on what you are going to use it for. The one thing I didn't like about the Buckmaster was the interface for accessing the different databases. So it has forced me to write a no-nonsense (MANY TIMES FASTER/IN C/COMPILED FOR SPEED) search utility for ALL the databases they offer on the CDROM.

I think Buckmaster should consider dumping the shareware portion of the CD and provide an even more extensive database of information. This seems to be their strong point.

: --

In 1987 with the ECPA (Electronic Communications Privacy Act) this
all changed. Even though you have no choice that you in the privacy
of your home are bombarded with every kind of radio waves, certain
frequencies if intercepted (even without revealing the contents to
anyone or acting on their contents) can land you a felony prison
sentence.

On April 26th 1994 the FCC has prohibited the manufacture or importation
of any 'scanning receiver' that can intercept cellular frequencies.
Receivers that can intercept cordless phones will be next.

Like gun control, the administrations have learned that chipping away at
freedoms is much more politically feasible than outright bans. The
strategy is apparently working too.

Amateur radio enthusiasts, for example, have never had the right to
encrypt messages over the air, nor to talk explicitly about sexual
or other bodily function, rights that are virtually taken for
granted on other mediums. But amateurs have placidly accepted
these infringments even though it wipes out the possibility of
experimental automatic Usenet/Internet packet servers because
those restrictions have been in place so long and the original reasons
for their implementation were so plausible.

A new version of the pgp encryption program has been released (version 2.5);
telnet to net-dist.mit.edu, logon as 'getpgp' and follow instructions
to get your own copy. This version is FREE of any patent problems in the
United States. Includes complete source.

"We need to do what ever we can to get more folks up there"?

Sounds like good rationale for completely eliminating the code requirement
for HF access.

I'm sure the concept of just making people extend a little *effort* to
get access to those bands never entered their mind. Gosh no, wouldn't
want to make it hard now... that would be bad for sales.

>Yep, they were there, doing just what the locals said, alright. Too bad. In
>fact, the engineer told the locals that they better be careful, these people
>might retaliate on the local hams for turning them in.

The field engineer has a boss to whom you can "escalate" the lack
of responsiveness. That is always a process that should be
followed. The engineer's boss has a boss too and if you
follow the ladder, you should get to someone who cares (or
just doesn't want to be bothered anymore and will push for
resolkution just to make you go away).

> The League has been
>asked for help, the Official Observer people have been informed, but so far,
>nothing has been done. The local hams have tape recordings by the dozen, they
>know exacly who these people are, where they live, where they work, the few
>who actually do work, etc. Still, the FCC nor the League will or can do
>anything about it.

Certainly the FCC can do something, you need to get to the
right party and that may mean you (actually it is better if
many of the area hams collectively puch the FCC) need to
keep escalating to higher and higher management.

If all else fails, write your congressman for the area.

As for ARRL getting directly involved, remember the ARRL
has No enforcement ability. Best they can do is help
gather evidence that would stand up in court if needed.

>Now, I ask you, if these people can do this with impunity, why the heck should
>the rest of us EVER worry about iding on time, or saying a cuss word now and
>then, or even bother getting a license at all.

A valid critisism under the circumstances, but my personal
philosophy is never lower yourself to the level of the scum
you want to eliminate.

>Oh yeah, I forgot, one of them is using a call that is assigned to a guy who
>lives in St. Louis, which is a long way from here and he ain't the guy from
>St. Louis.

More evidence for the FCC to pursue.

>This whole thing makes me sick, and my folks and the rest of the ham community
>in the area are really ticked. Wouldn't you be, too?

I can't think of anyone reading this newsgroup that would not
agree that the situation you described needs immediate attention.
Odds are, the FCC only needs to nail one of the offending
parties to the cross and the rest will pack up the
HTs and go somewhere else.

>Now, what should they/we do about this situation. Does anyone have any kind
>of connection with the FCC? Is there anyone out there who gives a damn?

See comments above, I (we) certainly all give a damn.

Michael--

Rather than trying to find out what makes this sort of individual tick, do a little judicious radio direction finding. Once you have tracked down the location of the individual causing the interference, you can then decide what steps should be taken. If it turns out that it is someone that is well known on the repeater, a simple phone call might work wonders. If no one knows the individual or their phone number then other action might be appropriate, such as documenting the interference and notifying the proper authorities. I would not recommend face to face confrontations or retaliations... :) Good luck.

The situation described certainly does fall under the actual
wording "immediate safety of life.However, the actual wording
contained within Part 97 applies only to LICENSED AMATEUR operators
and stations! 97.5 is very clear on this point. It does not allow
operation without a station license. The paragraph to which you
refer, 90.405, applies ONLY to Subpart E, not to the entire

unlicensed population of the USA in general. It specifically states
"amateur station" and the person above said that he had passed the
test but had not yet received his station authorization.

Should he do it again? YES! Is it legal? Clearly the answer is NO.
The recipient of care can later provide a defense if it is required.

Generally if you are anywhere near the flight line or ramps you are
required by OSHA to wear hearing protection. Those muffs are going to
make it impossible to hear a speaker mic at the audio levels available
from your HT.

What you really need is either the one-piece unit mentioned above (and
Ear-Mic is a registered trademark of DynaTech/Unex/Controlonics) or a
combination earmuff / speaker unit. There are several manufacturers of
these, including Telex, David Clark, and DynaTech. Obviously you wear
the one-piece unit UNDER the standard issue OSHA earmuff provided by
your employer.

1898. World-Chip (7910) info needed

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-11 01:17:30 UTC
From: DAVID@pitvax.xx.rmit.EDU.AU
Message-ID: <01HC7LWENXPU8WXHRE@pitvax.xx.rmit.edu.au>
Source record: 267056

I posted this to rec.radio.amateur.digital.misc and got no reply. I'm keen to get an answer so am reposting here.....
.....

Hi Packet fans!

I'm trying to assemble equipment to get started on this mode. I've come across an old modem that has a 'AM7910DC WORLD-CHIP' in it. I've heard that some TNC's use the 7910 chip, so am wondering if this is the same?

I will need circuit and pin strapping info for it as well - the original modem offered 1200/75 operation only. Looking in the packet directories of several ham archives (uscd, funet, buffalo) has yielded nothing on basic 1200b modems. I heard of a modem cct. in the 1992 ARRL handbook, does this use a 7910?

While I'm asking questions... can anyone tell me if 1200b packet (Bell 202) uses straight FSK and what the audio frequencies are? I can't find this info anywhere :-(

Thanks in advance

David

> What do you think?

I think you're trying to make this more complex than it is. Wireline links are allowed by the rules for linking repeaters. The net is not different from telco links in any reasonable way as long as you use connection oriented protocols. In fact that's the way the telco works these days. There's no need to delay and babysit the link to the extent you suggest. All you have to do is make sure that the link behaves in a manner similar to a traditional wireline connecting two repeaters.

The only real problem you have is timely delivery. The net is slow compared to straight wireline connections. If you can maintain sufficient throughput, the net is a valid telco substitute. If you can't maintain sufficient throughput, the net link will be useless.

Source record: 267200

The institutional response of the matter being a "League personnel matter" does not hold water. It would if ARRL were a private, for profit firm. But in fact is it supposedly a non profit, with a board elected by the membership, and the League makes a big point of being responsive to, and attentive to, the membership and its concerns. Precisely because it is a membership service organization, and concommitantly because Luck was an important person in field service, the League does all, including itself, a disservice by "toughing the issue" in this way.

I don't know Luck personally but have spoken with him on occasion and know that he has worked very hard over the years. This is not the way to reward a hard working employee; a rule of reason should apply where bureaucratic rules are instituted. Somewhere along the line the Managers and bureaucrats have forgotten what the primary reason is for the existence of the organization itself!

I worked in public broadcasting for nine years and resigned two years ago because I witnessed much internal mismanagement and based on my own experience and the various correspondence I've read re. the Luck Hurder matter, I really think ARRL has let a bad tactical employee relations decision snowball into a strategically indefensible position.

Greater than 2 MeV Electron Fluence for 10 MAY is: 1.4E+09

SYNOPSIS OF ACTIVITY

Solar activity was very low. No significant events were
observed this period. New Region 7721 (S12E73) was numbered
this period as a BXO beta group with 2 spots.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field has been at quiet to active levels, in the middle latitudes, for the past 24 hours. High latitudes experienced quiet to active levels with minor to severe storm conditions observed at local nightitme.

STD: Electrons at greater than 2 MeV continued at high to very high levels today. These high fluence levels could continue through to early next week.

Geophysical activity forecast: the geomagnetic field is expected to be mostly quiet to active for day one of the forecast period. Minor storm levels can be expected at high latitude stations during local nighttime. The field is expected to moderate to mostly quiet to unsettled for the remainder of the forecast period. Some isolated active periods can be expected.

Event probabilities 11 may-13 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 11 may-13 may

A. Middle Latitudes
Active 20/25/25
Minor Storm 25/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/25
Minor Storm 25/20/10
Major-Severe Storm 05/05/05

HF propagation conditions continued below-normal from the upper middle latitudes to the polar latitudes. Areas most heavily affected were paths crossing through the influential auroral zones. Conditions are expected to very slowly improve over the next 72 hours, but are not yet expected to fully return to near-normal values.

Source record: 267202

There are MANY different federal agencies which have an application
for portable/mobile spectrum analysis, & emitter location, using both
discrete & non-discrete (such as what you saw) platforms, in the DC area!

If it were almost any other region but DC, I'd be willing to guess
the car was an FCC vehicle (most of them look ordinary from a distance,
until you look in the window & see that the front passenger seat has been
replaced with a SIGINT/MASINT console + VHF 2-way radio & CMT!

Tim

P.S> I'm very glad to learn that the FCC has some new toys. I hope
they've also spent $$ on hiring more personnel.

>in the sticks. Where is the ARRL and the FCC? Maybe they are afraid of
>liability suits or making waves?

Just like here in the Pottstown, PA. area. We have had a banana operating
on the repeater frequencies for over a year. Last year this unlicensed
person was investigated by the hams and FCC and found to be transmitting
illegally also on the police and fire frequencies. He was fined, which
last I heard he hasn't paid, and is still interferring with the repeaters,
cursing, playing music, tapes of ham conversations, etc. The FCC is now
ignoring all compaints against this person.

Which Senator or Congressman holds the purse strings for the FCC? Anyone
know? Letters to our local Representatives seem to have no effect.

Source record: 267209

I've been a ham for many years, and it's apalling the degree of rudeness that has worked its way into a hobby which was once characterized by courtesy and politeness. Apparently some hams think they "own" certain frequencies for the exclusive use of themselves and their buddies -- who usually don't identify themselves by callsign -- and these guys get really incensed if anyone dares to "trespass" on their frequencies! I always check to make sure a frequency is clear before transmitting -- what kind of a fool wouldn't??? -- but it's kind of hard to tell a frequency is "in use" if nobody has transmitted on it for five minutes, wouldn't you say?

Also, the language is getting really foul...Fox Charlie Charlie needs to be listening more closely!

Let's get back to some decency and courtesy on the bands, people! This kind of garbage is for the CB crowd!

Alas, it does. The reality of being an employer in these times is that you must follow the going practices. And, like it or not, those practices include keeping your mouth shut as regards involuntary terminations for (what you think is) cause, unless you're talking to either your attorney or a government official. The practice applies whether you're IBM, the ARRL, or the Catholic Church; the law doesn't discriminate in protecting employees from their employers, and 'anything you [the employer] say can be used against you...'

That said, such rules cut both ways: while they protect the employee from being defamed, they also give villanous employers a convenient hiding place to avoid being held accountable by those to whom they supposedly are accountable (the public, members, stockholders, congregations, etc.).

The real answer is for concerned members to *demand* of their directors that Luck's boss convince a very cynical Board that what he did was the right thing to do. That's what the Directors are entrusted with. Heck, that's the whole reason that representative democracies exist... ...so that everyone doesn't have to hash over every issue.

>I don't know Luck personally but have spoken with him on occasion and
>know that he has worked very hard over the years. This is not the way to
>reward a hard working employee; a rule of reason should apply where
>bureaucratic rules are instituted. Somewhere along the line the Managers
>and bureaucrats have forgotten what the primary reason is for the existence
>of the organization itself!

We all know that organizations develop a life of their own over the years, along with certain pathologies. It's fair to say that the ARRL has a real problem with control issues, and it sounds to me that Luck's experience is a good example of this.

It is my impression that a few back-office suits were concerned about staff participation in this forum... ...I note that other ARRL staffers have somewhat altered the character of their participation since the Luck Hurder dismissal.

Unfortunately, I'm afraid that these largely faceless folks on the ARRL payroll, who incidentally probably believe that they're supposed to 'run' things, have no clue as to how to use this medium as a tool, and therefore responded incorrectly to its use. Yes, there are concerns when an individual staffer posting from HQ can editorialize to a

circulation which rivals the distribution of the League's own official organ, QST. However, neither the Board nor the Senior staff, whom we never see here are equipped to understand the issues.

The right thing to do would have been to convene a group of hams who are familiar with the medium and with the League (perhaps headed up by someone like, oh, Bill Sohl) to come up with a set of policy guidelines for HQ staffers who wish to augment their responsiveness to the membership in the USENET forum. The guidelines could be sent to the Board for approval, and should be approved based on the Board's faith that their appointees know what they're doing.

That's one level, the question of the policy.

On the question of Luck's employment: well, it was clear that it was a somewhat stormy relationship, and that Luck was willing to shake the system a bit in order to get things done. The very fact that he was called in to sign some sort of promise in order to retain his employment indicates that the relationship had gone pretty badly south. The 'wild ducks' in any organization are important; but they also tend to lose their effectiveness after a while, and need to migrate. Otherwise, they cease to be wild ducks! The ARRL is in a tough position--- ---can it allow staff members tell the management 'no' on questions of policy? Even when the policy is wrong, or stupid, isn't it the job of the staff to do as directed? I know it's not that simple. It never is.

I suspect that we haven't seen the last of Mr. Hurder. People like himself tend to convert setbacks into opportunities.

As any of us who've ever tried to turn our car with our feet, or stop it by tipping both toes forward, or jambing our heels out and down can attest, it's important to remember this. Also, the car doesn't go any faster when you reach over and push in on the cigarette lighter. And people chuckle when you absentmindedly yell 'clear prop!' before twisting the car key!

I'm in the process of upgrading one of our 440mhz repeaters here in
the area, and I'm looking at the ICOM RP-4020. I'm curious if anyone
has had any experience with this machine.

Specifically, I'm wondering how easy this repeater is to modify.
It does not come with an autopatch, for instance - has anyone
added a patch to one of these repeaters, and if so, how difficult
was it?

Another annoying quirk of the repeater is that it IDs every time
someone lets the tail drop. This does not appear to be a user-changable
feature. Anyone know of firmware patches available?

The League may claim to be a non-profit firm, but in fact it is a for-profit publishing house. The sooner people start to realize this they will be better off.

If you have any doubt, open any issue of QST and count the number of ARRL publications. Books, study materials, code tapes, license videotapes, the list is endless.

The League may be "non-profit" from the viewpoint of the IRS, but its certainly not non-profit from the viewpoint of the staff members who have made a career out of living off your membership fee to the League. Take a look over the years in the various issues of QST. Examine the names of the staff members. Look familiar? Seemingly never change? How many years has K1ZZ made a living off your membership dollars? Do you enjoy paying for his house, car, and vacation each year?

Many DXers will tell you that they "use" the frequency waiting for someone
to appear from a country they want to work. So it may be silent for many
minutes - to a hour while they wait, but if you fire up there you will
get lots of complaints.

It doesn't seem right to me to characterize "the CB crowd" in this way.
Hardly in the traditional ham radio spirt of friendly politeness! Many
CB operators display much better operating practices and courtesy than
found on 75 phone almost any evening.

I would imagine something of that sort would have to be done using
a buffer to store the voice data and sent all at once, in the same fashion
as a simplex repeater operates. The rise and fall of network traffic would
make for a choppy converstaion if it were done real time.

Sounds like a good idea none the less...

I totally agree IF you restrict the comment to below 50 MHz and some FM.

I almost blew off ham radio until I made some contacts on 6m and 2m SSB.
I'm also impressed at the civilty on 432 MHz.

I must say that I'm not in a metropolitan area, nor can I easily hear the
nearest big city (Denver) on the bands mentioned.

Come on up!

Almost all non-profit organization have extra sources of income to reduce dues and subsequently increase membership. Would you be willing to pay $60 rather than $30 a year? I support the ARRL publications to a degree that they are good, advertisments are screened (e.g., no Maxon non-tune antenna tuner), and opinions reflect the interests of the ham community. Someone wrote that salaries at ARRL are rather low and it could be difficult to attract best people. If you want ARRL to be better, will you be willing to pay higher dues?

Most non-profit organizations have fund raisers. Very few actually make
it a point of actively selling material at market prices - in fact,
alot of places, such as PBS, simply offer you a bribe of some trinket
when you donate money.

The recent flack about the Repeater Directory project and the League
taking a hard-nose stance that they would go to court to protect their
copyright shows pretty clearly where their interests are.

|> Would you be willing to pay $60 rather than $30 a year?

I would be willing to pay for what I use.

|> Someone wrote that salaries at
|> ARRL are rather low and it could be difficult to attract best people.

I have no comment on this, I haven't seen the salaries.

|> If you want ARRL to be better, will you be willing to pay higher
|> dues?

If I received something for my dues, rather than an increasingly large
number of ads at the front of each QST every month. And, perhaps a section
manager who actually filed the section news and did something. Perhaps
a working O.O. system. The list is endless.

But that's okay. The League can continue to take the stance of "quantity
before quality" and do whatever they can to reduce the entrance requirements
to ham radio (and thus sell more study guides.)

Ken, have you considered that, since there are only 8 GMRS repeater
channels, anybody's (type-accepted for Part 95) 8 channel radio covers
your repeater testing needs as well as those pesky legal requirements
of the ever-meddling FCC? Once programmed, your test unit will be
useful for a very long time. If you also want talk-around and simplex
on the 5W ERP offsets, the maximum channel count required is 23
frequencies.

If you are doing testing into a dummy load and you run the illegally
modified and operated portable directly into the receiver through a
decent RF attenuator, you won't have any external radiation to worry
about. You also could use a simple RF signal generator and a frequency
counter if the sig-gen is too simple and therefore unstable. Either way,
your amateur and GMRS licenses will then not be in jeopardy.

Of course, being a law (and FCC Rules) abiding amateur, you DO also
hold a valid GMRS license or letter of authorization from the licensee
for each and every one of those GMRS repeaters you access on the air,
right?? I know that your employer (and mine) takes a VERY dim view of
any FCC rules violations, particularly if they could be business-related.

> small unit, low voltage amplifier. Not a lot of RF output with the
> standard battery pack.

It is interesting that Yaesu would publically distribute a "MARS/CAP"
mod in the USA when they are fully aware that neither of those services
are authorized to operate anywhere in the 420 MHz to 460 MHz frequency
range. The official range for the military and Feds is 406-420 MHz,
420-450 MHz is us amateurs (except up here near the Canadian border),
while the 450-460 range is under FCC jurisdiction and is used for land
mobile Parts 20, 90, and 95 amongst others.

>
> -Ken

It also ensures at least a minimum standard of equipment technical
performance which amateur operators are not required (and most are
not equipped) to maintain. This is a necessary condition in any
channelized radio service. Let's try not to give the Amateur Radio
Service another black eye by defying the FCC Rules!

We have received a science grant to visit the North Slope of Alaska, on the Artic Ocean, at Point Franklin which is a barren uninhabited peninsula located between Barrow and Wainright. The purpose is for archeological exploration with a 3-D ground penetrating imaging system. I will visit about 5 times over a period of three years starting in July 1994. I need advice on the best way (equipment and procedures) to set up a briefcase size packet link through a satellite. There is no power where I am going, except batteries and a charging generator that will be used to power the laptops used for data logging.

Also, need comments on HF setup. I have a Kenwood TS-50 and tuner but need comments on antennas and bands. The communications link desired is from the Alaska site back to Pittsburgh, PA.

Perhaps 5min may still count as an occupied frequency, but 5min to an
hour
doesn't. The most absurd statement I have heard is that a "dxer" has the
"right"
to complain because someone may use the frequency that nothing has been
heard
on for 5min or more. That certainly isn't real friendly band sharing.

POLICE AMATEUR RADIO TEAM (PART) OF WESTFORD ANNOUNCEMENT
FOR IMMEDIATE RELEASE
FOR FURTHER INFORMATION, CONTACT: Terry Stader, KA8SCP
Tel: (508) 692-2069

The Police Aamteur Radio Team (PART) of Westford, MA is once again providing the communications for the Tour de Lowell Citizen's bike races on Sunday, June 12, 1994. We have counted on many of the ham radio operators volunteers for previous years and again are asking for your help. The Lowell Sun, sponsor of the race, took a year off last year... but are starting up the annual event again this year!

The race runs fron 8:30 AM until about 11 AM and is 30 miles long travelling through towns in Massachusetts (Lowell and Dracut) and New Hampshire (Windham and Pelham). We will be getting together at about 7:30 AM. We'll be meeting in downtown Lowell for assignment of station location throughout the route to provide "some" traffic control as well as safety operations. We need at least 25 hams or more to safely run this net. So anyone is welcome to join us.

If you would like to help us out this year... you are invited to inquire or send me your information about how I may contact you to any of the below listed addresses. All you need is a 2 meter ht (although there will be some 440 cross-band activity for some of the remotes) and a little time Sunday morning.

Please let me know if you would like more information or would like to just say yes!

73 for now.... c u on the shortwaves

> > |> equipment:
> > |> 1. REAL good and big antennas (theory: if the last
> > |> storm didn't blow them down, they were not high
> > |> enough). Like how about a 120 foot tower.

Why only one tower, W1AW has several. However, if towers blow down, they
are no longer useful to support antennas, but the price is not reduced in
any proportional fashion.

> > |> 2. Nice low band rig with all the goodies, like
> > |> amplifier, filters, RTTY, AMTOR, ...

>
> Sounds like a bunch of elitists to me. This is not within the spirit of
> amateur radio at all.

It's no worse than many repeater clubs whose members don't participate
in HF contests, moonbounce, etc. ARRL does not discriminate between these
groups, it encourages activities that benefit amateur radio.

> I'd say that such a club should be frowned upon by the amateur community
> and not given any undeserved respect. 73

I see no reason to frown, just consider it another special interest group
spending their own private funds to enjoy their hobby. ARRL members are
in the same position, and look at the respect accorded that organization.

Do you really believe that truly non-profit firms go without paid employees?
If so, you are naive.

Hello all...

I need information about the Internet for a college paper on communications. I need the what, when, where, why, who, and how on the internet. I also need help files, FAQ's, and anything else anybody can send me via e-mail.

My problem is that I do not have finger, ftp, gopher, or any of the fancy stuff on this box.

Please send me any information you have, I have 256 Megs available on my box, so feel free to send as much info as you want.

Please do not send replyies to the newsgroups, please send replies directly to my mailbox at 'andrews@telemax.com'

Thank you very much...

How about
the Association for Computing Machinery (ACM)
the IEEE
the TeX Users Group (formerly based in Rhode Island)
the National Audubon Society
the Smithsonian Museums
and I'm sure you can think of lots more that have IRS non-profit
status but which maintain an extensive line of "products" (books,
magazines, sometimes trinkets, etc.)

>The recent flack about the Repeater Directory project and the League
>taking a hard-nose stance that they would go to court to protect their
>copyright shows pretty clearly where their interests are.

Non-profit doesn't mean that they have to *lose* money! In fact if
you've been involved in the management of a non-profit association
you'll know that almost all of them devote large amounts of energy
into figuring out how to fund raise (or how to market themselves) so
that they have the resources to carry out the goals they were
chartered to meet.

Also if you've been involved in such organizations, you'll recognize
that very rarely is there an explicit conspiracy going on to warp the
organization in one way or another. Odd as it may seem, people's
opinions often moderate and change once they become responsible for
carrying out an in-depth examination of the needs of a community and
the ways in which an organization can meet those needs. Sometimes
it's just common sense given the facts of the situation. I have found
it "interesting" to watch the goings on in one organization in which a
new slate of officers totally disrupted the staff operations in the
name of reform, only to end up a year or two later adopting many of
the same policies and procedures for which they had castigated the old

officers.

Is this good or bad? I don't think one can say. There are lots of different kinds of organizations and lots of different ways to achive an end.

There is a program mentioned in the linux area called "atalk" which takes incoming audio to a soundblaster card and transmits it through an internet connection to another location (anyway, this was my understanding). I think it would be limited somewhat by the current speed of dial-in connections (14kbps) and the lousy throughput of most internet service providers (including this one).

Luck has always been something of a loose cannon. As I said
before, that's one reason I liked him. But I must admit, that
tendency as always kept him in hot water at HQ. People who like
their turf neat and tidy were probably waiting for an excuse.

I am reminded somewhat of the sergeant in Andy Griffith's first
movie, "No Time For Sergeants."

: and not given any undeserved respect. 73

Huh? Why?

A group of folks without the resources to build a high-end station individually, getting together and pooling their resources to do so sounds very much in "the spirit of amateur radio" to me. While I personally would rather slowly put my dollars into building my individual station, I certainly see nothing wrong or elitist about the proposal.

I have the following INSTRUCTION/OPERATORS MANUALS up for grabs:

HY-GAIN THUNDERBIRD (TH3Mk30 THREE ELEMENT HAM ANTENNA

CDE HAM II ROTOR

These INSTRUCTION/OPERATORS MANUALS are in various states of
condition. Some are in good condition and some are in poor condition.

The intent is to give these INSTRUCTION/OPERATOR MANUALS to an
individual or entity who ACTUALLY has the equipment.

The first person to send me e-mail gets the booty. Please send a
separate e-mail request for each INSTRUCTION OR OPERATORS MANUAL. You
will be asked to send a SASE (large manila or other envelope) with the
appropriate amount of U.S. postage to me c/o the address in my .sig
file.

Good luck to one and all.

I think I get much more value from the league than my dues
pay for. I probably get more than my dues dollar amount
in QSL Bureau services alone, never mind all the other
valuable services.

I have no qualms with K1ZZ or any of the other staff of the
league making a living off my membership fees as long as
I feel they are providing a valuable service.

Maybe I don't agree with everything they do, but I certainly
feel that they provide a great service to all amateurs, not
just their members.

Stop whining and if you don't want any of the league's
benefits than don't join, don't participate in DXCC or WAS,
don't QSL by the bureau, don't ask for legal assistance,
don't ask for local technical assistance, don't read QST,
don't attend an ARRL VE Session, don't ask for international
licensing information.

I don't remember the issue, but check the annual index to QST for the last year or two in the "Hints & Kinks" section. There was a novel circuit using auto headlamp in series with an AC/DC power supply to charge batteries for just the purpose you request. The auto light limited the current draw of the power supply at full demand, yet kept a constant charge on the batteries.

The article showed use of isolation diodes and MOV's as well; sorry I don't remember the actual issue.

Cross-posted to: ne.general,rec.aviation.misc,rec.radio.amateur.misc

If you enjoy aircraft of any type, or even wonder what this is all about, don't miss this event! This is a *lot* of fun for everyone. Last year's event was a huge success. Many enjoyed it as much as any full scale airshow. Typically there are more than sixty aircraft in attendance. This year we have some new events designed to please the audience even more than last year. We are not talking about flying toy's here. Last year we had some aircraft with eight foot (yes, 8 feet) winspans. Yes they were flying, and saying that they were aerobatic would be putting it mildly!

*****

THE NH FLYING TIGERS R/C CLUB SIXTH ANNUAL RADIO CONTROLLED MODEL AIRSHOW

Located in Derry/Londonderry New Hampshire

Featuring flying and static displays of radio controlled models.

Sunday, June 5th

Flying begins at 10:00 am

Spectators are welcome

Food and refreshments available

One new ready to fly R/C
airplane will be raffled off!

(bad weather date is Sunday, June 12th)

100% of the fify cent gate addmission
goes to the local United Way

Directions: From the North or South take I-93 to exit 5 in New Hamshire. Head southeast (turn right if coming from the South, left if coming from the North) on Rout 28 for 2.7 miles until you pass Walmart. Take the next street on your right ("A" street) and follow the signs to the event.

For more information call Ken at (603) 432-7345 (evenings and weekends)

Well maybe the person is flying an aircraft, but I think listening for a
few minutes will tell you for sure. Actually I don't really care to much
what people say on the repeater as long as it isn't profane, I just consider
the source.

Marty

Well, that was my first reaction when it happened to me while trying
to find a clear spot to keep a sked on 75 Phone in the wintertime. I'm
not a (serious) DXer, but on reflection I thought it no worse than the
many nets that keep "their" frequencies occupied for a time before the
"net" actually begins as well as during the operation.

I think it absurd for anyone to claim priority of use for any frequency,
be it dxer, a net, or me and my weekly sked with K9BGL. But, listening may
be use just as much as talking! I think anyone has a "right" to ask others
for cooperation and receive a civil response. I do think that an
increasing number of hams is showing a "me first" attitude about this that
makes it difficult to "smile" and oblige, sometimes. When _politely_ asked
to move, I prefer to oblige. I sometimes don't although the threats from
the net operaters to involve the FCC with their multiK$ fines makes it hard
to refuse.

1952. Re: use INTERNET for linked repeater?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-11 20:33:02 UTC
From: teacherjh@aol.com
Message-ID: <2qrfdu$20q@search01.news.aol.com>
Source record: 267046

Am I too much of a purist? It would seem to me that using landlines to linke repeaters (or using the internet, which is even more complex) would defeat the purpose of radio communication... which is to eliminate dependance on landlines.

'Course, I could easily be wrong.. I don't have much experience in the matter..I'd be interested in reasons for contrary thoughts. :)

Subj : New Product

1. Hi, The name here is David, I would like to announce the availiblity of a new product called the Handy Holder, This product will enable you to secure your handy or scanner in your vehicle without the worry that a sharp turn will cause it to go slidding in the other direction.!
In addition this product is designed to allow maximum use of all controls and allows for power cables to be attached (giving you max Wattage).... Please find this product in the July Issue of CQ Mag. or call (901) 476-7171 during business hrs (CDT) for more info also you may leave E-MAil for DAvid Siglin on this system or on Prodigy (UWKJ62a) for info.

Thanks in advance
Dave

1954. Re: Followup: Was this a bad idea?

Newsgroup: rec.radio.amateur.misc

Source record: 267051

Regarding your emergency transmission while unlicenced...

It was not a bad idea. It was a good idea. It was also perfectly legal. The FCC regulations state that in a bona fide emergency, anybody may transmit over any band, using any mode, any communctaions that is necessary or prudent to save life and property. I don't know the exact wording of the law, but it definately covers what you did, which was a GOOD thing.

Welcome to radio... and public service. :)

Jeeze, Louise, why not let the hams order their pizza? Individual repeater Gods can set their own Gestapo policy and say "NO, NO!!! NO PIZZA!! NO DOCTORS APPOINTMENTS!!!!" as they please, and others can say, go ahead, order your pepperoni and get those fillings... So take a chill pill! I was a member of a very nice 2-meter autopatch only repeater for a while (until I moved) and it worked out very nicely. It even had a shortcut for dialing 800-numbers (something like *8-xxx-xxxx). I hope more of you old farts lighten up about what HAMS do with HAM radio autopatch for their own convenience and clamp down on NON HAMS using our frequencies and stealing bandwidth. So if you want to get tough on rules, go T-hunting for jammers and leave us alone.

I posted a message about the intermod I am getting on a rooftop near downtown Chicago. I can sort-of manage around it right now, but I sure would like to filter out a lot of it. Anyone have a cheap, used, unwanted can used for taxi or something laying around, or know where I can get one? Please, no more "buy Motorola" mail. You can, I'm sure, eliminate intermod from a "jap" (sic) radio, but you can't, to my knowledge, enter frequencies from the keyboard into a Motherolla, nor can you press a key and get cross-band-repeat, nor can you control them remotely, nor can I afford them. So remember, this is "Be Kind To 'Jap' Radio Owners Week" and send me some solid info I can use to filter out some of the pager crap overloading my front end on 420-450. Thanks!!!!!!!!! :-) Ed

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 11/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 11 MAY AND FORECAST UP TO 14 MAY

IPS Warning 13 was issued on 09 May and is still current.

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 082/023

1B. SOLAR FORECAST
12 May 13 May 14 May
Activity Very Low Very Low Very Low
Fadeouts None Expected None Expected None Expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 084/026

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: unsettled to active, with minor storm
levels 00-03UT.

Estimated Indices : A K Observed A Index 10 May
Learmonth 25 5434 4433
Fredericksburg 22 24
Planetary 25 28

Observed Kp for 10 May: 4463 3335

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
12 May 20 Mostly unsettled; isolated active periods possible.
13 May 25 Unsettled to active.
14 May 35 Active with minor storm levels.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
11 May fair-normal fair fair-poor
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
12 May normal fair-normal fair
13 May fair-normal fair fair-poor
14 May fair-normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values 00-11UT and
21-23UT. Depressions of 40% occurred from 16-20UT while spread
F and sporadic E were observed 11-20UT.

Observed T index for 11 May: 22

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
12 May 25 Near predicted monthly values.
13 May 20 Near predicted monthly values.
14 May 20 Near predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
Spread F may degrade communications during night hours.

1960. Re: SCPC equipment and experiences sought...

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-12 00:05:45 UTC
From: frede@microsoft.com
Message-ID: <CpnxLn.HFs@microsoft.com>
Source record: 267156

Actually, the ICOM R-100, R-7000, and/or R-7100 can be used for SCPC reception with very good results. The IF filtering on these receivers may not be totally optimum for all SCPC channels (some are wider IF, some are narrower) but overall, my experiences (with the R-100) have been very positive. I use a DC block and Y-connecter (both available) at Radio Shack to keep the DC out of the scanner.

Message-ID: <768702124.AA02884@mcws.fidonet.org>
Source record: 267062

Destinate is an attempt at being cute. It is cute all right, but after all these years has become a pain. It's in the same category as saying 73s or 'numbers' or 3s. It's wrong, and while there is nothing wrong with the basic idea, people should be aware of the correct way.

Our society encourages illiteracy, short cuts, and general decadence. But changing human nature is impossible, so I guess I will just keep trying to do it the best way and hope others will take care of themselves.

>modem offered 1200/75 operation only. Looking in the packet directories
>of several ham archives (uscd, funet, buffalo) has yielded nothing on basic
>1200b modems. I heard of a modem cct. in the 1992 ARRL handbook, does this
>use a 7910?

Yes.

>While I'm asking questions... can anyone tell me if 1200b packet (Bell 202)
>uses straight FSK and what the audio frequencies are? I can't find this
>info anywhere :-(

Typically, Bell 202 is used via AFSK over FM voice radios. Bell 103 is
used at HF, either FSK or AFSK over a SSB radio (that amounts to the
same thing with a good SSB rig). The Bell 202 tone frequencies are
1200 and 2200 Hz. Bell 103 has two sets of tones depending on whether
it's in originate or answer mode. They are 1070 and 1270 for originate
mode and 2025 and 2225 for answer mode. Typical HF operation is in
originate loopback mode.

AM7910 pinouts are as follows:

Pin Signal
1 !Ring (tie high)
2 Vcc (+5 volts)
3 Reset (tie between a .033 uf cap to ground and a 1 meg resistor
tied to 5 volts)
4 Vbb (-5 volts)
5 RC (this is receive carrier, feed receiver audio to it through a
a 0.68 uf cap and bridge a 10 k resistor from the pin to
ground.)
6-7 Join these two pins with a 2000 pf cap and 100 ohm resistor in series
8 TC (this is transmit carrier, feed to microphone input via 0.68 uf)
9 Ground
10 TD (transmit data TTL, feed through 1489 RS232 converter chip)
11 !BRTS (tie to +5 volts through a pullup resistor)
12 !RTS (request to send, feed through 1489)

13 !CTS (clear to send, feed from 1488 RS232 converter chip)
14 !BCTS Not used
15 BRD not used
16 !DTR (Data Terminal Ready, feed through 1489)
17-21 MC0 thru MC4 mode programming pins. (see below)
22 Ground
23-24 Crystal/clock (connect with a 2.4576 MHz crystal and put a 22 pf
cap from pin 23 to GND and a 15 pf cap from pin 24
to GND)
25 !CD (carrier detect, send to 1488)
26 RD (received data, send to 1488)
27 BCD Not used
28 BTD Not used

Program modes
MC4 MC3 MC2 MC1 MC0 Function
1 0 0 0 0 Bell 103 orignate loopback
1 0 0 0 1 Bell 103 answer loopback
1 0 0 1 0 Bell 202 main loopback
1 0 0 1 1 Bell 202 loopback (equalized)

The mode you want for 1200 baud packet is 10010. A 1 is a pullup to 5 volts
and a 0 is a ground.

73 TU SU DE NA4G BOB AR

Greetings CWISTS and Boatanchorites:

I will be on again at 0400UTC for the continuing saga of the Sacred and
Most Honorable Friendly Society of Brass Pounding Fist Functioning CWISTS.

Last Friday Night, there were a fine bunch of ops on 3702.5khz.

This week I will work first on 3527.5khz, and you others
take over on 3702.5khz. If there are no sigs on 3527.5khz
I will back up to 3702.5khz, myself. Someone else call first
and start the ball rolling at 0400UTC.

Standard time: Friday Nights at 0400UTC

Standard freq: 80 meters --- 3702.5 khz for Novices and SlowSpeeds, et al.
3527.5 khz for Generals and Advanced, et al.
3517.5 khz for Extras and Europeans, et al.

40 meters --- 7102.5 khz (between the heterodynes)
7027.5 khz for Generals and Advanced, et al.
7017.5 khz for Extras and Europeans, et al.

--- --
Standard calling signal: CWIST IMI DE <yourcall> K

The interest for this weekly function continues to grow. There have even been some interested Europeans asking about it. Many of the INTERNET Boatanchor mailing list folks are aboard.

Let us all work together to continue to advance and promote the friendly use of CW on the amateur radio bands.

Let us continue to assist and help the newcomers and slowspeeds who are trying to get their CW going.

Let us to continue to promote the use of whatever gear you have up and available, be it the newest of sorts or the oldest boatanchor. Remember, CW generation has not changed since the days of arcs, Alexanderson alternators, and Pliotrons.

Let us continue to promote the sharing and fellowship of the history and traditions of amateur radio (this includes all you OTs out there that have all sorts of goodly tidbits of history to relate to the young squirts on the block, and it includes all you young squirts on the block who, even though a bit new at CW and radio are the future of the service hobby or profession).

Let us continue to promote the ``elmering'' of all of our new folks by the old timers aboard, in any way that we can.

So, OTs aboard, young squirts in the wings, high-speed afficionados of the art, and slow-speed ragchewers, join in on the fun. If your equipment is old boatanchor, so what. If your signal is a bit weak or chirpy, so what. If your antenna is just a mere piece of wire up into the trees, so what. YOU can still join in and participate.
YOU are the folks who will make it what it can be, a goodly learning time and an enjoyable evening for all.

See You There OM/YL.....

>>certainly isn't real friendly band sharing.

>You are exactly right. I couldn't agree with you more.

I disagree, within limits. There are standard DX frequencies
in the phone bands that are used by DXpeditions and individual
DX operators, such as 3795, 14195, 21295, 28495. These are
recognized worldwide as DX gathering places. If you know this,
and insist on starting a ragchew on 14195, I think it would be
unnecessarily provocative.

DX newsletters will often say "Expedition such-and-such will
operate on the standard DX frequencies", and they are small
enough in number and well-enough known by most hams that it
is courteous to avoid those for casual operating when possible.

Whether this is what the original poster is thinking of, I have
no idea, but outright condemnation of DXers for wanting to keep
one frequency per band clear for their sport is not warranted.
It's a little like claiming that it's OK to park right next to
a fire hydrant because there hasn't been a local fire for the
last 5 minutes.

The 3-Hr Ap Indices for 10 MAY 94 are: 34 30 69 17 14 16 19 36
Greater than 2 MeV Electron Fluence for 11 MAY is: 2.2E+09

SYNOPSIS OF ACTIVITY

Solar activity was very low. No significant events were
observed the past 24 hours. New Region 7722 (N07E81,
Carrington Longitude 122) was numbered this period as a DHO
beta group with 4 spots. Rgn 7722 appears to herald the return
of old Rgn 7701 (carr lo 120) which produced only weak activity
its last pass. All other regions have exhibited slow decay.
Two filaments disappeared this period: a 10 degree long

filament centered at N34E30 and a 19 degree long filament
centered at S35W24.

Solar activity forecast: solar activity is expected to be
very low. We will watch the development of new Rgn 7722 for
enhanced flare potential.

The geomagnetic field has been at mostly quiet to active
levels with some isolated periods of minor to major storm
conditions. The GT 2 MeV electron flux was in the very
high range.

Geophysical activity forecast: the geomagnetic field is
expected to be mostly quiet to active for the next three days.

Event probabilities 12 may-14 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 12 may-14 may

A. Middle Latitudes
Active 25/25/25
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/25
Minor Storm 20/15/10
Major-Severe Storm 10/05/05

HF propagation conditions are very gradually improving,
but remained below-normal over the high and polar latitude
circuits. Night-sector signal degradation is the strongest
over these regions. Conditions should continue to improve
gradually over the next 3 to 5 days.

EVENTS WITH SWEEPS AND/OR OPTICAL PHENOMENA FOR THE LAST UTC DAY

Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
---
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

It is possible to get a switch that turns itself on when you turn the
ignition of your vehicle of. They can quite easily be installed if you are
in any way interested in electrics or know anyone who is.

>But that doesn't seem to make sense to me, because its the CB that needs
>the steady power supply not the LED....shouldn't I add the capacitor
>in series with the CB instead?? Or do I need some kind of low pass
>filter? Any clues?

The idea of using a capacitor is a good one, it is the way that cheap
power supplies change your A.C. mains into a D.C. supply, it basically
works by softening the peaks of power that the supply sees, when the led
is off, the capacitor charges at some rate (V=V1e^-Ct I think) then when the
led is on, the capacitor discharges at another rate, however it is still
charging at the other rate at the same time. This is the alternative to
having no capacitor in which the led is either on (power supplied) or off
(power not supplied) and these power surges may be the reason for the clicking
that you hear accross the CB. Of course if you examine your led, you may find
that since it is a flashing led, that there is already a capacitor in it
for the timing mechanism, this is not to be worried about as it is usually not
that serious however the sudden discharge from this capacitor could be such thatit is the
reason for your RF interference if it is a cheap capacitor.
Then and again, the capacitor would probably not be in line with the led, and
attached to a transistor so that when it went over a certain potential, the
led would come on. Any way enough babling for the moment, I gotta head to
a lecture, (Thermo Dynamics I think).
Hope this lecture has not been too boring for you, and has helped somewhat.

Bye-D-Bye

There is room for honest disagreement here, and I disagree with you thoroughly. Firstly, I've been an amateur since 1966, and I've never heard of the frequencies you reference in the context you mention. Not once. And I subscribe to CQ and QST. If I didn't know about it, how many of the many many newcomers who are upgrading to general class and above are gonna know it? Darned few, that's how many.

The dx stations have VFOs on their rigs just like the rest of us. They can move a few Khz right or left. If someone else is using the frequency, then that's too bad.

I've had a sked for years with a buddy on 14.0765. At a certain time, I sure wish the rest of you would stay off it. For some reason the rest of hamdom doesn't listen to my pleas and we often have to sidestep. :-)

Sorry, but I think you are wrong on this one.

I bought RS's speaker-mike that they recommend for the HTX-202. It seems
to work fine, and I have had good audio reoprts using it. As a more
specific reply to your question, the RS speaker-mike package/instructions
has written on it in large letters: "Yaesu and Icom compatible", whatever
that means. But remember that YMMV, etc. etc.

In many corners of the globe, the 'club station' is the norm, as are
shared facilities in many hobbies.

The US is the exception, the home of affluent rugged individualist
conspicuous consumers, where individual ownership of something that's
used a couple of hours a week seems to be the way of doing things.

Perhaps we'll wise up when we move to condos...

...I always thought that ideal places for ham club stations would be the
many abandoned duck clubs that seem to have fallen from favor, but still
have faciliies out in the marsh-lands.

A very cynical attitude indeed, and one which undermines the
whole structure and purpose of the ARRL and reduces it to a
set of goods and services.

Since when is commenting on the policies and practices of a
democratically-controlled organization of which one is a member
subject to being called 'whining?'

To me, the 'whiners' are those who don't step up to issues and
face them squarely, but instead choose to attack and denigrate
those who do.

So Russ, after reading your post and a couple of follow-ups, I didn't
get a since whether $24.00 was the annual cost of a license or the
annual cost of a vanity license.

Is that the base cost of a license?

Oh, bullfeathers! What he is describing is simply a club station without
the formal club structure. People have been pooling their funds to buy
boats, airplanes and vacation cabins forever. What is so evil about using
pooled funds to put together a better station than they could individually?

I am not a lawyer and the suggestion I would offer is Draconian and will not win you any friends, but it is possible to sue federal officials to demand they perform their official duties. (remember Marberry v Madison?)
Some situations require Draconian measures that don't win you any friends. I hope never to be there, myself.

: : DX operators, such as 3795, 14195, 21295, 28495. These are
: : recognized worldwide as DX gathering places. If you know this,
: : and insist on starting a ragchew on 14195, I think it would be
: : unnecessarily provocative.

The fact is that hardly anyone knows about this "standard"! This is
especially true for the newer amateurs, and is also true for old-timers
as well.

To claim an unpublished "standard" for DXers to the rest of the world
only serves to create hard feelings between everyone trying to share the
frequencies and discredits the serious DXers.

: Firstly, I've been an amateur since 1966, and I've never
: heard of the frequencies you reference in the context you mention.

I've been licensed since 1960 and have never heard of a "standard
DX frequency", either. I subscribed to the NJDXA newsletter for a year and
never saw any mention of a standard DX frequency or frequencies. Even if
there were a list of standard frequencies published in these newsletters,
how would the majority of the amateur population know about them? The
number of hams who read these publications is relatively small.

Let me suggest that if there is to be a set of standard DX frequencies,
that some concerned DXer take on the the responsibility of getting the word
out to a "reasonable" percentage (let's arbitrarily say 30% or more) of the
ham population by writing articles for the major amateur publications (QST,
CQ, 73, WorldRadio and maybe a few others) with the information.

I am willing to abide by any reasonable "gentleman's" agreement on
DX frequencies that can be generated (by reasonable, I mean one frequency
per band +/- 2.5 KHz, since that is basically what is now on the table).

Note: Whoever takes on the responsibility of proposing or publishing
the standard may be known as "the keeper of the standard" and be subject
to the fame and flame associated with the title! Any takers?

: There is room for honest disagreement here, and I disagree with you
: thoroughly. Firstly, I've been an amateur since 1966, and I've never
: heard of the frequencies you reference in the context you mention. Not
: once.

You live under a rock? Never read the DX bulletin from Newington on Thursday
afternoon? Mentioned all the time.

: The dx stations have VFOs on their rigs just like the rest of us. They
: can move a few Khz right or left. If someone else is using the
: frequency, then that's too bad.

Of course when 3Y0PI or such comes up on frequency and doesn't hear the
ragchew, moving the DX and the policemen is interesting.

: I've had a sked for years with a buddy on 14.0765. At a certain time, I
: sure wish the rest of you would stay off it. For some reason the rest of
: hamdom doesn't listen to my pleas and we often have to sidestep. :-)

Read your comment about DX stations having VFO's. Don't you have one?

Other frequencies of interest ....

14.230 - SSTV gathering spot. calling CQ here is greeted with a
answer in SSTV. The CQ'er generally moves.

14.300 - maritime net stuff and phone patches to the stock broker.

14.313 - see 28.325 below, but not limited to N. Texas

14.336? - county chasers net

14.260, 21.260, 28.260 - island chaser frequency.

28.325 - Nortn Texas Jammers Society. CQ'ing on this frequency is
generally greeeted with a long blast of profanity and
endless tirades. Fortunately the skip is no longer in.

Darrell Shandrow (nu7i@nowhere) wrote:

: Sounds like a bunch of elitists to me. This is not within the spirit of
: amateur radio at all.

There's no real reason for this..... if the folk involved lack the skill to use all that wonderful radio equipment and test equipment, they can be as elitist or rich as they want, they just won't be very successful :-) The budget doesn't seem to include funds for buying skills, ability and experience.

AND, If they are all red-hot keen operators, I don't want to be anywhere in range when the fighting breaks out over who gets to operate it in the favourite contests

: I'd say that such a club should be frowned upon by the amateur community
: and not given any undeserved respect. 73

: Darrell Shandrow at Arizona State University

This is the sad part, I can see how such a club could cause jealousy and resentment. If it wants respect, it will have to earn it just like everyone else.

There will be folk who feel no resentment, those who built stations capable of giving it a very hard race, on a modest budget by effort and careful trawling for useful junk and components.

No. "The Communications Act of 1934", as amended ad infinitum, authorizes anyone, anywhere (within the jurisdiction of the US, anyway) to use *any* (radio) means necessary in emergencies. The wording of Part 97 is there only to guarantee that amateurs do not *lose* that privelege due to having a specific radio license.

No, no, you climb one of the trees and put the mast for your vertical up toward the top of one of them. The ARRL Antenna Book includes more details. You should probably feed with low-loss openwire rather than coax, due to the length (see Reflections, by Maxwell). Or, you can use jungle creepers to build a hammock up in the canopy somewhere, for the ideal in operating comfort.

In Europe the most "sacred" DX frequencies are on 80m at 3500-3510 CW
and 3790-3800 SSB. If one listens instead of transmitting only, one
finds himself peaks of activity on selected frequencies. Also,
pile-ups prevent any unsuspecting ham from succesful QSOs there.

I remember once a local station calling CQ on 3798 in a local contest.
There was a confusion over the call of the replying station (it
was DM).

Newington CT May 11, 1994
To all radio amateurs

SB QST ARL ARLB043
ARLB043 2300 MHz comments sought

2300 MHz comments sought

The FCC has issued a Notice of Inquiry on reallocation of spectrum from federal government use (in ET Docket 94-32). 50 MHz of spectrum would be transferred to private sector use, possibly as early as this summer. The comment deadline is June 15, 1994.

The reallocation is called for under the Omnibus Reconciliation Act of 1993, which requires the Department of Commerce to identify 200 MHz of spectrum below 5 GHz to be reallocated within the next 15 years.

The spectrum identified for immediate reallocation is at 2390 to 2400 MHz, 2402 to 2417 MHz, and 4660 to 4685 MHz. Amateurs share the first two ranges. The Commission said that ''there are a number of factors associated with existing allocations of the bands that will affect their potential for private sector use.''

The FCC specifically asked for input on whether the proposed reallocations would adversely affect amateur operations, especially amateur satellites. The Commission said that ''The Department of Commerce expects that the amateur service community can satisfy the majority of its spectrum requirements in the remaining 35 MHz (left after the proposed reallocation). It also believes that current use of the 13 cm band by amateur stations is light compared to use of bands lower in the spectrum, but notes that use may increase for amateur-satellite, high-speed computer data links, amateur TV, and other wide-band applications.

''The Department of Commerce states that it excluded the 2400-2402 MHz band from consideration for reallocation in order to protect existing amateur satellite operations.''

DE> I'm posting to alt.music.filk; I don't belong to fidonet and have no
DE> intention
DE> of recognizing its rules & regulations.

Dick, the fact of the matter is that it is against the law to post
copyright material into a public forum without permission of the
copyright holder. In the Filk forum, many of those of us who write
songs have given blanket permission to redistribute any of our material
(not for profit) through the echostream.

However, posting copyright material WITHOUT either blanket or specific
permission is a violation of Federal copyright laws. Whether you post
from FIDO, Internet or the White House itself is not the question --
each and every sysop and node which carried your message with unlawfully
distributed copyright material can be sued by the copyright holder for
YOUR violation.

Consider how long your access to alt. ANYTHING would last if your
access point were fined by Federal court . . .

And before you say "Nobody would care about ONE LITTLE MESSAGE," let
me note that the publishers' associations refer to such open-and-shut
violation cases as "ringing the cash register;" they rarely lose, and
when they win they ALWAYS make a sizeable profit. Aside from the
profit, the zero-tolerance policy prevents those of us in the know from
taking liberties with other people's work.

Since Filk is in a grey area already, it wouldn't take much to cause a
lot of us a LOT of trouble for people who have gone to a lot of effort
and expense to provide this forum that you have endangered. So why not
just apologize and get back to the party?

|
+---+
Here's a newswire item I came across in my travels.

5\02 Gene Roddenberry's Ashes Did Fly On Shuttle

The ashes of Star Trek creator Gene Roddenberry were flown aboard a
space shuttle after his death in October 1991, a NASA spokesman said
Thursday. "I can confirm that the ashes of Mr. Roddenberry did fly on a
shuttle mission and it was approved for flight as a personal effect of
an astronaut," said spokesman Brian Welch at the Johnson Space Center
in Houston.

Having just moved, I have the following questions:

Does the FCC still supply form 610 to amateurs?

If so, does anyone know the phone number of the nearest office
in the Phiadelphia area?

Thanks.

Where have all the sunspots gone?

Except for officially designated sub-bands for phone, cw, et al, NOBODY OWNS ANY PART OF THE AMATEUR SPECTRUM...DXers, loudmouth no-call-sign ragchewers, or anyone else!!! If a frequency ain't in use, it AIN'T IN USE! Can't reserve seats at an open-seating concert and can't reserve frequencies, either!

The idea of checking for "frequency in use" is of course a different thing...something we should all do. Sometimes, however, longwinded qsos (transmissions of 5 minutes plus!) make it impossible to hear one end of the exchange.

> : FEEL is 'inappropriate'????????

Possibly this thread discussed this long ago... but I hope anyone adhering to this advice without inquiry of others is using their own personally owned and maintained repeater.

The four machines with patches in my area are all known to be very leniant on usage (whatever's legal goes), but lest we forget it: the control operators of any machines have total censorship over what gets retransmitted through their box. (If it's carrying their callsign- why should they be forced to associate their call with whatever someone want's to argue/say/use the patch for... especially if their are legal questions to the conduct).

I for one will not stand by and let people abuse my patch if they are obviously using it in place of of having a phone at their house. The autopatch is a convenience for mobile and portable users, and for emergency use- and nothing else (not to mention the questionable legality of patches at fixed points where phone service are available).

Use it, but don't AB-use it.
--or-- Too much of anything is simply too much.

2000. GB2RS News 15th May 1994

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-12 18:45:46 UTC
From: dave@llondel.demon.co.uk
Message-ID: <768793546snx@llondel.demon.co.uk>
Source record: 267167
Cross-posted to: uk.radio.amateur,rec.radio.amateur.misc,rec.radio.info

Good morning. It's Sunday the 15th of May and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- Israel has signed the CEPT reciprocal licence agreement; fifteen teachers took the RAE last week and there's a vacancy on the RSGB HF Committee.

The Radiocommunications Agency has informed the Society that Israel is now participating in the CEPT T/R 61-01 agreement. This means that a reciprocal licence is no longer required for UK amateurs to operate in Israel.

The STELAR Group has reported that their first crash RAE course for teachers was a great success. The week-long residential course was sponsored by Trio-Kenwood UK and was held at their Watford Headquarters. The training involved both practical and theoretical aspects of amateur radio. Fifteen teachers took the Radio Amateurs Examination on the 9th of May. They are expected to use amateur radio as a classroom aid.

Attention all RAE Tutors and students: the latest issue of 'How to become a radio amateur', published by the RA, no longer contains the licence conditions. These appear in the 'Terms, provisions and limitations' booklet BR68 and it is important to order both booklets at the same time. RAE candidates can obtain them from the Radiocommunications Agency by calling 071 215 2352.

A DXpedition to the Shiant Isles, south-east of the Isle of Lewis, is scheduled to take place from the 27th to the 30th of May. The team comprises: GM3NIG, GM3UTQ, GM4FDM and GM4YMA. Operation will be on all bands 160 to 10m, mainly around IOTA and WAB frequencies using the callsign GB8SH. Primary mode will be SSB, but CW, AMTOR, Pactor and RTTY will be available on request. Shiant is IOTA EU 112 and WAB NG49.

The HF Committee of the RSGB has a vacancy for a keen HF DXer. The committee, which is responsible to RSGB Council for all HF matters, meets approximately every two months in the London area. If you feel you can help, write, with brief details of any relevant experience, to the committee chairman, David Evans, G3OUF, P O Box 599, Hemel Hempstead, Herts, postcode HP3 0SR.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From Ascension Island, N6TJ will be active as ZD8Z from Friday the 20th of May, until early June.

From St Eustatius, K3UOC will sign PJ5/K3UOC from Tuesday the 24th until Tuesday the 31st of May, mainly on CW. During the WPX CW Contest he will sign PJ8H.

And from Marianas Islands, JA6VZB and JF6BCC will sign respectively AH0T and KH2GR/KH0 from Thursday the 26th until Monday the 30th of May. Activity will be on all bands 160 to 10 metres on CW, SSB and RTTY, including participation in the WPX CW Contest.

We are very sorry to have to report the death of the founder of the DX News Sheet, Geoff Watts, last Monday the 9th. He will be greatly missed.

Now the events for today Sunday the 15th of May:

The Dunstable Downs Radio Club Annual National Amateur Radio Car Boot Sale is being held at Stockwood County Park, Luton, Bedfordshire, near junction 10 of the M1 motorway. Doors open at 10am. The event features trade stands, clubs and a car boot area. Other attractions include admission to the Environmental Open Day, free entry to the Mossman Collection of Horse Drawn Vehicles, craft museum and carriage rides.

The Mid-Ulster Amateur Radio Club Parkanaur Rally is being held at the Silverwood Hotel, Lurgan, County Armagh. Doors open at 12 noon. The event features trade stands, a bring and buy stall and an RSGB Book stand. Refreshments are available. Talk-in is on two metres, channel S22.

Next, the one event we know of for next Saturday 21st is the First Ipswich Computer Show which is to be held at Willis Corroon Sports and Social Club, The Street, Rushmere Saint Andrew, Ipswich. Doors open at 10am. For further details telephone 0473 272002.

And now two rallies for next Sunday the 22th of May:

The Gloucester Radio Rally is to be held at Nass Lane, Quedgeley, Gloucester, located off the old Bristol road: look for the signs for Quedgeley Rally. Doors open at 9am. The event features a car boot sale, a bring and buy stall and a flea market area. Further details from Mike on 0452 503786.

The 37th Northern Mobile Rally which is to be held at the Flower Show Hall, on the Great Yorkshire Show Ground, Harrogate, North Yorkshire. Entry and parking is off the Wetherby to Harrogate road and there are separate arrangements for disabled visitors off Hookstone Wood road. The showground opens at 10.00am and the rally doors open at 10.45am. There are the usual trade stands, a bring and buy stall and refreshments. Talk-in is on channel S22. Further details from Mike, G0MKK on 0423 507653, evenings only or via G0MKK at GB7CYM.

Next some dates for your diary:

The Plymouth Radio and Electronics Fair, organised by the Plymouth Radio Club for the 29th of May, has changed venue to Coombe Dean School, Charnhill Way, Elburton, Plymouth. This is due to circumstances beyond the club's control. Further details available from Derek, G7ESZ on 0752 364150.

This year's RSGB Headquarters Open Day is scheduled for Saturday, the 4th of June. Further details can be found in the May RadCom.

The next RSGB Regional Meeting takes place at Brighouse in West Yorkshire on Sunday the 5th of June. These meetings are for members and non-members of the Society to meet Council Members, Society Officers and staff to discuss the workings of the Society and amateur radio related matters. For further details, contact RSGB Zonal Council Member Peter Sheppard, G4EJP, on 0964 550397.

The Annual Conference of the World Association of Christian Radio Amateur and Listeners takes place from the 7th to the 9th of October in Merseyside. The notice in the May edition of RadCom was incorrect. Further details can be obtained from Geoff Peterson, G4EZU, on 0474 533686.

HF contest news now:

The CQ-M Mixed Mode (Russian) Contest finishes today, Sunday the 15th at 2100. The contest uses CW and SSB from 1.8MHz to 28MHz but excluding the WARC bands. See May RadCom page 20 for details.

Next some VHF contest news:

The RSGB 144MHz Single, Others and SWL Contest takes place next weekend, from 1400 UTC on Saturday the 21st until 1400 UTC on Sunday the 22nd of May. There are four sections, Single operator fixed, Single operator Portable, Others and Listeners. Another category is Single operator fixed, operating for 6 hours continuously, but starting at any hour on the hour. See the February edition of RadCom for further details.

The first of the RSGB Back-Packers 144MHz Contests is scheduled to take place next Sunday the 22nd of May from 1100 until 1500 UTC. This is a new type of contest and full details can be found in January's RadCom.

Special event stations this week include:

GB0HSM which will be aired by the Worthing and District Amateur Radio Club from High Salvington Mill today Sunday the 15th.

GB500JC will be aired from Bristol for the keel laying ceremony for a replica of John Cabot's ship "Matthew" on Friday the 20th by the Duke of Edinburgh, Patron of the Project. Operation will be on 80, 40 and 20 metres. See May RadCom page 6 for further information.

Two-metre repeater GB3SA, was scheduled to be switched on last Saturday the 14th of May following a site change. The repeater is located east of Swansea and operates on channel R3, which has its output on 145.675MHz and input on 145.075MHz. Reports should go to the repeater keeper GW6KQC, whose address is correct in the RSGB Call Book.

And now the solar factual data:

As expected, the period from the 2nd to the 8th of May saw magnetic storms every day with generally poor HF band conditions. However, for

those lucky enough to catch the Sporadic-E on the 6th and 9th, both the 28 and 50MHz bands gave good contacts all over Europe. Solar activity has remained very low; no M or X flares have been reported since February the 27th and no active regions are at present on the disk. The sunspot indices meaned about the 45s. Solar flux levels have averaged 74 units and hardly varied from day to day. The 90 day flux average on the 8th of May dropped to 88 units, which is now reflecting the long period of very low solar activity.

The geomagnetic Ap indices have been up to storm levels every day, seriously affecting the higher latitudes. The period averaged 35.7 units, and was affected by the high solar wind speed due to the passage of repeated coronal holes. The electron fluence level which is a measure of this activity, has been very high all the period but was starting to decline as this bulletin was being prepared. The state has been 'nil nothing to report' throughout the period. The daily aa indices as supplied by the British Geological Survey for the period from the 26th of April to the 2nd of May averaged 22.2 nanoTeslas, but the 30th was very quiet, down to only 4.5 nanoTeslas with the pre auroral enhancement. The levels were up to 136 nanoTeslas on the 1st of May with the aurora. The X-Ray flux has declined again and averaged only A1.1 units, hardly varying day to day.

The monthly spot indices for April were RI 16.7 with the maximum of 40 on the 24th, and the minimum of zero on the 3rd, 6th, and 7th. The smoothed number for October 93 is 45 +/-5. Bartells rotation 2196 starts on the 14th May.

I'll repeat the figures. Spots - 45; Flux - 74; Ap index - 35.7; X-ray flux - A1.1.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, have been very depressed due to the magnetic storms, with the period average being only 6.7MHz. The level on the 7th was down to only 4.9MHz. The darkness hour lows averaged 2.5MHz with periods of spread F, and at times only the F1 layer was detectable.

I'll repeat the figures. Highs - 6.7MHz; lows - 2.5MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 4.9MHz and the darkness hour lows 2.5MHz.

I'll repeat the figures: Highs - 4.9MHz; lows - 2.5MHz.

And lastly the solar forecast:

This week the quiet side of the sun will be looking our way. Solar flux levels are expected to be about the 85s, and the magnetic activity is expected to be quiet to just unsettled. Ionospheric MUFs during daylight are expected to be about 24MHz for the south, and 21MHz for the north.

East/west paths will be difficult due to the seasonal changes now taking effect. Darkness hour MUFs for north/south paths are expected to be around 14MHz in the south.

And that's the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 Uniform Victor and G7 Sierra India series, and Novice calls in the 2 0 Alpha Hotel and 2 1 Charlie Yankee series.

--

GB2RS is prepared by the Radio Society of Great Britain and is broadcast in the 80m, 40m, 6m and 2m bands.

2001. Profiting from Spectrum?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-12 18:46:02 UTC
From: n2ayj@aol.com
Message-ID: <2qttha$ib1@search01.news.aol.com>

In article <CpI1v4.CFB@news.Hawaii.Edu>
jherman@uhunix3.uhcc.Hawaii.Edu (Jeffrey Herman) writes:

>No one is making a monetary profit from Newsline. But I wonder if someone
>might be profiting from the airing of Spectrum. If so, then Big Steve
>is conducting commercial advertising on the rec.radio groups.
>
> >Jeff NH6IL

That depends on what you mean by "profiting". In the sense that Spectrum accepts advertising to offset it's costs, it could be viewed as a commercial venture. However, none of the staff or guests get paid. I'm sure that in someone's view, all of our supporters could be said to be "profiting from the airing of Spectrum". Is it being run FOR PROFIT? Not to the knowledge of any of the studio crew.

Which brings me to my next point....

Somehow, folks have gotten the idea that Steve is intimately connected with the operation of the show and it's production. I am here to state that this is NOT THE CASE. Steve has a segment on the program, just as do other correspondents, and has a good deal of latitude within that segment. But that's it. He does not own, pay for, produce, direct, OR SPEAK FOR Spectrum. Any opinions that he expresses are his own. Spectrum maintains addresses to which listeners can address comments and queries, and from which 'news and official information' emenate. If it did not originate at one of those addresses, it's conjecture and opinion.

And I agree...this conversation, if it is going to continue, should indeed go somewhere else (r.r.shortwave?) because it definitely doesn't belong here.

: Unfortunately this LEDs are the blinking kind, and when the LED blinks
: it causes a "tick" noise on the CB. ... So one friend
: of mine suggested that I add a capacitor inline with the LED circuit,
: and that should solve the problem.

: But that doesn't seem to make sense to me, because its the CB that needs
: the steady power supply not the LED....shouldn't I add the capacitor
: in series with the CB instead?? Or do I need some kind of low pass
: filter?

The capacitor goes in parallel, not in series. (Otherwise no DC current would get through to power the device.) If the "tick" noise is coming in through the power cables, than it won't make much difference where the capacitor is located, provided it is somewhere in the line between the LED and the CB.

But the LEDs may actually be causing RF radiation which is getting picked up by the CB antenna. If so, then the best place for the capacitor is as close to the LEDs as possible -- inside the box if possible. I would try a value of around .1 uF (microFarad) or so. Keep the capacitor leads as short as possible.

If the noise is coming in through the power wires, then a larger value would be appropriate, perhaps 100 uF or so. A value of that size will be an electrolytic type, which is polarized. Make sure the end labelled "-" goes to the negative wire (usually ground).

If a simple capacitor doesn't work, you can buy more elaborate filters designed to eliminate ignition noise on the +12V power leads going to CB and stereo sets.

It's the way to indicate laughter on Morse code. Not sure why, perhaps it's because "di-di-di-dit di-dit" kind of sounds like a chuckle.

But saying "Hi Hi" on voice is kind of a nerdy ham thing to do. A real human chuckle gets the message across much better.

Here is what I was told by an OF - ex army radio operator:

In the early days of military use of radio to transmit orders (CW of course) the radio operators would, as would be expected, joke around. Unfortunately, it was not always possible to distiguish between "real orders" and someone's idea of a joke! This lead to some terrible missunderstandings.

The "Brass's" first solution was to order that no unofficial traffic could be sent. This didn't work, as "boys will be boys". Then they decided that any transmission meant as a joke had to be followed by "HI HI" which stood for "Humor Intended" (sent twice to make sure it was copied).

Maybe this is a "fish story", but that is what he told me.

>Jose KD1SB

Jose,
The purpose I originally thought of this setup for was for
an emergancy comm link to take the place of an HF link. Many
college club stations are comprised of no-coders only. Using
an internet hop instead of a hf hop would enable stations like
these (those with access to radio + internet equipment) help
out passing traffic in an emergancy. While in an emergancy the
'rules fly out the window' it would be nice to be able to
test such a system in a non-emergancy and be sure that you are
operating in the right.
from the responses I have received, people don't consider this
to be an action against the amateur radio rules. That of course
does not mean it's not though...

If they are actually on-air using the frequency then fair enough, but
'ownership' doesn't really start until the freq is being used. Otherwise
I claim the whole of 2M because I can arrange to use all of it at some
time during the day :-)

The only exceptions would be recognized calling frequencies, although
even there, the convention on VHF is that you QSY once contact is made.
It is almost a shame that the QSY doesn't apply to HF as well, although
propagation would probably make it impractical if everyone tried to use
the same frequency at once.

And there you have it. The considerate operator can easily find out
where certain special interest groups in our hobby congregate and will make
adjustments accordingly.

If you use your receiver, it is pretty obvious where the SSTV, AM,
DX, County Hunter, etc. windows are in the various bands. Those folks
hang out together so they know where to find each other and so they
don't take up too much room. Sounds like courteous behavior to me so why
not respond in kind?

There are, unfortunately, plenty of cases of arrested
development on our bands, but that doesn't me I (or you) need to join
them.

Allowing the special interest groups some operating space is
generally painless, courteous, and appreciated by all concerned.

You can find me (and lots of like-minded hams)
around 3885 and 7295 on AM, or sometimes chasing DX around
3795, 14195, or 21295.

Nick KD4CPL
nick@cs.unc.edu

and I know I've seen all this stuff published - in the ARRL Operating Guide
maybe, or a QST column ??

: > PB-18 Long-Life 7.2V 1100A 2.5W on High Power (approx. 7.0 hrs.)

: The 7.2V/700mA came with the radio when i got my TH-78E.
: It's small and fits completely inside the rig. I mainly use it when i
: carry the 78 around. Good for listening but don't talk too much.

So, PB-13 is equal to BT-8 if you have 700mAh cells in the battery pack.
Personally I (and my friend here) have used only batterypacks with my
Handy. Why? Becaus it's much cheaper to buy few sets of NiCd cells to
batterypack than buy a original pack; then you can twist and shout with
the sets (in public transportation system) when replacing the used ones
with full ones :)

(I have IC-2SET and IC-W2A and they both eat same packs. First ICOM had
the battery pack (case) BP-86 and you couldn't charge the NiCds through
it but then came the BP-90 and that's the best for me now.)

I've never used dry-cell-batteries in my packs.

: to get a set of those new NiMH cells that claim a capacity of 1200mA.

HI is to CW what a smiley ;-) is to the net. Using it on voice modes is just another instance of CW'ism that have crept into voice users' vocabularies. I'm not sure when or where it originated. It's used here too. I can see using some Q signals on voice once in a while, but saying hi,hi instead of just laughing seems really dumb. Oh well...

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 12/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 12 MAY AND FORECAST UP TO 15 MAY

IPS Warning 13 was issued on 09 May and is still current.

1A. SOLAR SUMMARY
Activity: Very low

Flares: None.

Observed 10.7 cm flux/Equivalent Sunspot Number : 087/030

1B. SOLAR FORECAST
13 May 14 May 15 May
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 090/034

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet to unsettled with active
levels from 00-03UT.

Estimated Indices : A K Observed A Index 11 May
Learmonth 11 4333 2112
Fredericksburg 11 25
Planetary 12 24

Observed Kp for 11 May: 4544 3334

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
13 May 15 Mostly quiet to unsettled. Possible active period
late in the day.
14 May 30 Unsettled to active with isolated minor storm
periods.
15 May 30 Unsettled to active with isolated minor storm
periods.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
12 May normal fair-normal fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
13 May normal fair-normal fair
14 May normal fair poor-fair
15 May normal fair poor-fair
3C. GLOBAL HF PROPAGATION COMMENT
Conditions should become degraded late today.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were mostly near predicted monthly values.
Spread F may have degraded F layer communications from 08-20UT.

Observed T index for 12 May: 15

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
13 May 20 Near predicted to 20% depressed.
14 May 15 Near predicted to 30% depressed.
15 May 15 Near predicted to 30% depressed.

4C. AUSTRALIAN REGION COMMENT
Spread F may degrade F layer communications during night hours.

Um... Al, you live up on the top of a mountain don't you?? Yeah... I remember
that I used to go up there and operate mobile before your house was built. :)
Let me see, you already have the station so all we need to do is hook up the
link, right? :)

I just recently received my license - KE6GTI. It was eleven weeks minus 1 day from test date to receiving it in the mail. It was nine weeks plus 3 days from test date to effective date.

Fully enjoying being a ham! Almost ready for 5 wpm code test!

Bob

2021. HTX-202 question

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-13 01:33:58 UTC
From: karayan@blitzen.cc.bellcore.com
Message-ID: <2qule6$6o3@blitzen.cc.bellcore.com>
Source record: 267091

I recently entered the world of VHF by buying the HTX-202 from Radio Shack.
I don't know how it compares to other HTs, but IMHO its user interface could
use a major overhaul. Must have been designed by the HT programmers ;-)
Many of the functions are not easy to remember. Here is one problem I have not
solved yet:

SOME of the repeaters I want to get into require a PL tone, so I program that
in the memory. The problem is that when I recall such a repeater freq from the
memory, the SETTINGS are OK, but it does not automatically turn the PL tone on.
So, I transmit but do not raise the repeater. I have to remember that this rpt
requires PL tone, to turn the tone on manually before xmitting. Wouldn't be
easier to automatically turn it on if the recalled memory requires a PL tone
on xmit? Can the HT still do that? How?

Cross-posted to: sci.electronics,rec.radio.amateur.misc

Does anyone have a data sheet for the 71A (or CX371A)
vacuum tube? I am looking for much more that just the
pinouts. Tube characterists and curves would be the
best. This tube dates back to about 1930.

Thanks.

Andy

Jim Hollenback (jholly@cup.hp.com) wrote:
: Roger Buffington (rogjd@netcom.com) wrote:

: : There is room for honest disagreement here, and I disagree with you
: : thoroughly. Firstly, I've been an amateur since 1966, and I've never
: : heard of the frequencies you reference in the context you mention. Not
: : once.

: You live under a rock? Never read the DX bulletin from Newington on Thursday
: afternoon? Mentioned all the time.

Not once buddy. Not once. They could mention it every 5 words and it
wouldn't make any difference to me. Or 99% of the other hams.

FYI, no, I don't live under a rock. Have a split level house in the nice
part of Glendale. How about you?

: : The dx stations have VFOs on their rigs just like the rest of us. They
: : can move a few Khz right or left. If someone else is using the
: : frequency, then that's too bad.

: Of course when 3Y0PI or such comes up on frequency and doesn't hear the
: ragchew, moving the DX and the policemen is interesting.

: : I've had a sked for years with a buddy on 14.0765. At a certain time, I
: : sure wish the rest of you would stay off it. For some reason the rest of
: : hamdom doesn't listen to my pleas and we often have to sidestep. :-)

: Read your comment about DX stations having VFO's. Don't you have one?

Yes, I do. Didn't you read my comment. I use it pretty often.

If you are gonna flame other guys on the net, then have the courtesy (or
brains) to at least read the message of the fella you're flaming. :-)

: Other frequencies of interest ....

: 14.230 - SSTV gathering spot. calling CQ here is greeted with a
: answer in SSTV. The CQ'er generally moves.

: 14.300 - maritime net stuff and phone patches to the stock broker.

: 14.313 - see 28.325 below, but not limited to N. Texas

: 14.336? - county chasers net

: 14.260, 21.260, 28.260 - island chaser frequency.

: 28.325 - Nortn Texas Jammers Society. CQ'ing on this frequency is
: generally greeeted with a long blast of profanity and
: endless tirades. Fortunately the skip is no longer in.

: Jim Hollenback, WA6SDM

FWIW, the only one of those freqs I'd ever heard of was 14.230.

News Release

RADIO AUTHORIZATION SUSPENDED

VANCOUVER, May 6, 1994 - The District Director, Lower Mainland Office, Spectrum Management Division of the Department of Industry (formerly known as the Department of Communications), today announced that the department has recently SUSPENDED for a period of ONE YEAR the Amateur Radio Operator Certificate, of Michael Courtney JOHNS. Mr. Johns Amateur Radio Licence (call sign VE7MCJ) was also under review, but expired during the review process.

The suspension means that Mr. JOHNS is ineligible to renew his former amateur radio licence, or apply for a new amateur radio licence, for the duration of the suspension period. The Radiocommunication Act PROHIBITS the possession, installation or operation of radio equipment (unless specifically exempted) without a valid radio licence.

The suspension came after a joint investigation between the Maple Ridge R.C.M.P. and the department revealed that Mr. JOHNS had possession of modified amateur radios programmed to transmit on a police frequency.

The District Director stated that while a shorter suspension would normally have been applied on a first offence, the circumstances of the case were such that a more lengthy suspension was called for.

Charges under the Radiocommunication Act have also been laid against Mr. JOHNS.

>landlines.
>
Well, the FCC likes us to experiment with such things, one reason they
give us the bandwidth.
Also heard that the Internet survived pretty well in the LA quake.
The extra bandwidth could come in handy during emergencys. it's
another system that might survive, the more seperate systems you
got, the chances of having at least a bare mimimum of bandwidth
available are improved.

Besides, there's not much else you can do with a repeater that hasen't
been done before.

2028. ISC revokes Amateur Radio licenses (#2)

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-13 03:00:39 UTC

News Release

RADIO AUTHORIZATIONS SUSPENDED & REVOKED

VANCOUVER, May 9, 1994 - The District Director, Lower Mainland Office,Spectrum Management Division of the Department of Industry (formerly known as theDepartment of Communications), today announced that the department has REVOKED theAmateur Radio Station Licence (call sign VE7IOZ) and SUSPENDED the Amateur Radio Operator Certificate, of Erik TERWIEL.

The revocation and suspension came after an investigation by departmental radio inspectors revealed that Mr. Terwiel had been found in possession of modified amateur radios programmed to transmit on a police frequencies.

The District Director stated that while a radio license "suspension" would normally be applied on a first offence, the circumstances of the case were such that a full radio licence revocation was called for.

The Radiocommunication Act PROHIBITS the possession, installation or operation of radio equipment (unless specifically exempted) without a valid radio licence. The licence revocation means that this prohibition now applies to Mr. TERWIEL.

The certificate suspension mean that Mr. Terwiel is ineligible to apply for a new amateur radio licence until January 10th, 1995.

The 3-Hr Ap Indices for 11 MAY 94 are: 31 38 27 27 15 17 15 23
Greater than 2 MeV Electron Fluence for 12 MAY is: 1.3E+09

SYNOPSIS OF ACTIVITY

Solar activity was very low, however, numerous activity
was reported last period. A total of 16 B-class x-ray events
were recorded, most of which were optically uncorrelated. The
two largest, a B7 at 12/0409Z and a B9 at 12/0524Z were
accompanied by strong discrete and sweep frequency radio
bursts. Numerous moderate to strong sweep frequency emissions
have been observed this entire period. Two weak to moderate

B-class/SF flares were reported from Region 7722 (N07E81). This DHO beta spot group appears to have some delta characteristics, but is still rotating onto the disk. New Region 7723 (N10E30) emerged early this period as a BXO beta spot group but has grown in the last few hours to a DAO beta.

Solar activity forecast: solar activity is expected to be very low to low. Both Regions 7722 and 7723 exhibits good potential for C-class activity.

The geomagnetic field has been at quiet to active levels for the past 24 hours. The GT 2 MeV electron flux levels have decreased to the high range.

Geophysical activity forecast: the geomagnetic field is expected to be mostly quiet to unsettled on day one of the forecast period. On day's two and three, geomagnetic activity is expected to increase to mostly unsettled to active with some minor storm periods. This is in response to a favorably positioned coronal hole.

Event probabilities 13 may-15 may

Class M 05/10/15
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 13 may-15 may

A. Middle Latitudes
Active 20/30/25
Minor Storm 05/25/20
Major-Severe Storm 01/05/05

B. High Latitudes
Active 25/30/30
Minor Storm 10/30/25
Major-Severe Storm 01/10/05

HF propagation conditions improved over the last 24 hours as levels of geomagnetic activity subsided to quieter levels. High and polar latitude paths have observed improvements to near-normal values, at times. Middle and low latitude paths are observing normal propagation. Propagation is expected to remain near-normal over all regions on 13 May and then may again take a dip toward slightly degraded values (particularly for high and polar latitude paths) as the next disturbance degrades signal qualities. This anticipated disturbance should only last a few days before conditions begin returning back to near-normal levels.

EVENTS WITH SWEEPS AND/OR OPTICAL PHENOMENA FOR THE LAST UTC DAY

Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
------ ---- ---- ---- ---- -- ------ ------ --------------------------
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

If these manufacturers' goal is for EVERY licensed ham to have HF privs then they had better first fight like hell to get us more spectrum; 40M is jammed every evening out here in the Central Pacific. I've taken to riding piggy-back on the SW BC stations to carry on QSO's (no need for the BFO to be on - CW QSO's, news and music all at the same time!)

30M sounds completely unused from out here; how's it sound to you folks on the Mainland? Why don't about 5,000 of you 40M buffs use 30M tonight?

2031. single ch x-tal receiver?

Newsgroup: rec.radio.amateur.misc

Does anybody out there know of any single channel receivers that run off of crystals? (ie scanner crystals) Preferably something cheap. Kits are fine.

I am very involved in Fire, EMS, ARES, etc. and I need to monitor several freqs at once. I want to set up a unit that can receive all the freqs I need without scanning, that way I don't interfere with one or another freq.

I've seen Ramsey's receiver kits, but I'm afraid that they would somehow become "untuned" if they got moved around, or a little cousins hand found the knobs, etc. I would like something that I could just pop the xtal in and be pretty much set.

Thanks and '73!

Matt

I think Radio Shack sells a single crystal unit. Also, there is the AOR AR33
which is a very fine thumb-wheel tuned vhf receiver (hand-held).

2034. Digest of Articles - QST Sep 93 (Long, 33k)

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-13 09:11:52 UTC
From: wvanho@infinet.com
Message-ID: <2qvg8p$64a@ve6mgs.ampr.ab.ca>
Source record: 266250

DIGEST OF ARTICLES -- QST, September, 1993

Following are digests of articles printed in the September, 1993 issue of QST. Such digests are being prepared for each issue of QST, and posted periodically. Subsequent issues will be posted one per week until they "catch up" to the current date in mid-1994, thereafter monthly.

It is hoped that other hams will volunteer to post similar digests of the other ham technical publications such as QEX, CQ, 73, COMMUNICATIONS QUARTERLY, RTTY JOURNAL, et al. Especially desirable would be digests of publications in other countries, such as the RSGB RADIO COMMUNICATIONS and ham magazines in Europe, Japan, Australia, and other countries around the world. We English speakers would especially enjoy them if they were translated into our language, but they would also be valuable additions to the world's knowledge if they were posted in the language of origin. Who knows? Some bi-lingual ham somewhere might translate them into English and re-post them.

Worldwide communications are getting better and better. The time has come to make the world's ham press available to all hams throughout the world!

The major value of digests is to give readers sufficient information to decide whether to obtain a copy of the full text. If any U.S. reader wants a copy of an article in QST, please inquire of other hams in your own neighborhood. Many have collections of back issues. Anyone who is unsuccessful in finding a fellow ham with a collection should try every library in the area, especially those at universities and technical colleges. If all else fails, a copy can be obtained from the ARRL Technical Department, 225 Main St., Newington, CT 06111-1494 USA for a fee of $3.00 per copy. Remember, it is both cheaper and quicker to obtain one locally.

Readers in most other countries can obtain copies from their own national ham organizations, sometimes translated into their own languages.

TECHNICAL ARTICLES

Title>TA1:A Long-Haul H-T Battery System
Author>Smithey, Thurman - N6QX
Source>QST Sep 93, pp. 23-26
Abstract>Construction of a relatively heavy-duty battery power supply, including recharger, for use with hand-held transceivers.

Digest>The author observes that VHF and UHF hand-held transceivers are commonly used for many different purposes but, sometimes, their utility

is limited by their short-duration batteries. To overcome that limitation he developed a portable, heavy-duty H-T power source that can be carried comfortably in a relatively small bag slung from a shoulder strap.

The system is designed to meet the following requirements:

1. It must be chargeable from any 10- to 15-volt d.c. source.

2. It must shut off automatically when the battery is completely charged, and must indicate when charging is complete.

3. It must provide an accurate means of indicating the discharge level of the battery as it is being used.

4. The battery output voltage must be regulated to suit the requirements of any H-T.

For reliability, he chose two 6-volt sealed, paste-electrolyte, lead-acid batteries. They are charged in parallel and connected in series to provide the necessary 12 volts.

The article contains wiring diagrams, parts lists including suggested sources, and full construction information. A footnote indicates that a pc board and parts overlay are available from FAR Circuits, 18N640 Field Court, Dundee, IL 60118. The board template and parts overlay are available free of charge from the ARRL Technical Department Secretary for a No. 10 SASE with a request for the "Smithey Long-Haul H-T Battery System PC Board Template Package".

A side-bar with the article discusses reconditioning used small lead-acid batteries which are stated to be frequently available for low cost at surplus outlets and hamfests. The author reports success at reconditioning batteries that were seemingly dead to a state of usability, although he has never been successful in restoring above 60 percent of the battery's original capacity.

Title>TA2:A Simple Broadband Dipole for Eighty Meters
Author>Witt, Frank - AI1H pp. 27-30
Source>QST Sep 93, pp. 27-30
Abstract>Describes a dipole with two matching-sections of coax in the feed line that provides low SWR over most of the 75/80 meter band.

The author observes that a conventional center-fed half-wave dipole cannot provide a low standing wave ratio over the entire 80-meter band. Those who want to use both the low end c.w. band and the high end phone band must use an antenna tuner or some other means of obtaining low SWR if they want to use solid state rigs.

Mr. Witt shows a broad-banding system which obtains a low SWR over almost the entire band. Measurements were made on a test antenna and a curve of SWR vs. frequency plotted. It shows two minima at about 3.6 and 3.9 MHz. respectively, rising to 1.8 at mid-band (3.75 MHz.), about

2.25 at the low end (3.5 MHz.) and 2.0 at the high end (4.0 MHz.)

He obtains these results through a simple modification of the conventional coax feed line. At the feedpoint (center) of the antenna a one-wavelength piece of RG-213 (50-ohm) cable is connected; the requisite number of ferrite beads are slipped over the first few inches to form a 1:1 balun. At the lower end of the RG-213 a quarter-wavelength piece of RG-11 (75-ohm) cable is attached. At the other end of that cable, 50-ohm cable is connected to run the rest of the way to the transmitter.

In a sidebar with this article, the author explains the operation his feed system. Assuming a 50-ohm transmitter output impedance, the quarter-wave piece of 75-ohm cable operates as a "Q-Section" that transforms the 50 ohms to 112.5 ohms. The half-wavelength of 50-ohm coax that connects to the antenna feedpoint acts as a "lossy resonator". He states that the technical details of the "lossy resonator" were covered by the same author in an article titled "Optimum Lossy Broad-band Matching Networks for Resonant Antennas" in R. F. DESIGN, April, 1990, pp. 44-51 and July, 1990, p. 10.

Finally, he discusses other variations of the same antenna drive system for use in lower power applications as well as in multi-band antennas.

Title>TA3:The Contest Card
Author>Sutcliffe, Gary C. - W9XT
Source>QST Sep 93, pp. 31-32
Abstract>Describes a computer plug-in card for use by operators in phone contests. It provides up to 4 recorded messages, totaling 16 seconds.

Digest>This article is a description of a plug-in card for PC compatible computers that the author has designed in the form of a kit for assembly by the buyer. His stated design goal is to put all of the accessories needed by serious contest operators inside the computer. Hence, it contains a voice recorder and c.w. interface, it is software compatible with the most popular logging programs, and can be built for less than the cost of most stand-alone voice recorders.

The circuit utilizes the Information Storage Devices ISD-1016A and stores up to 16 seconds of audio. It supports up to four messages such as: CQ, contest report, QRZ?, and call sign.

Recording is done using the same station microphone that is used in the rest of the QSO to avoid confusion caused if the voice should change between the CQ and the body of the QSO. On c.w. the card uses a relay to key the transmitter to allow operation with either positive or negative keyed rigs.

Detailed construction information, including schematics and software listings are available from the ARRL Technical Department Secretary. Ask for the "September, 1993 QST Sutcliffe Information Package" and include a large SASE with your request. Source code listings of the

software are available from the ARRL telephone BBS under the file name W9XT.ZIP.

A complete kit of all parts except for interface cable but including software is available from Unified Microsystems, P.O. Box 133, Slinger, WI 53086. Interface cables for most popular transceivers can be obtained from LTA Industries, P.O. Box 77, New Bedford, PA 16140.

Title>TA4:The 1/3 Wavelength Multi-Band Dipole
Author>Griffith, Andrew S. - W4ULD
Source>QST Sep 93, pp. 33-35
Abstract>Construction information for a multi-band dipole with a custom-built matching section that shows fairly low SWR on up to 7 different bands.

Digest>This article describes a multi-band dipole that is said to show a standing wave ratio of less than 2.3:1 at its feed point near the center of the 7, 14, 18, 21, 24, and 28 MHz. bands. On 80 meters, at the low band edge the SWR is more nearly 5:1 and a tuner is required. Any rig that uses a vacuum tube output stage can probably operate the largest parts of all seven bands without a tuner, but a tuner may be required on some if a solid-state rig is in use.

The antenna is a conventional wire dipole, 92' 0" long, fed in the center with an unusual kind of ladder line of 350 to 380 ohm characteristic impedance. Its length is 39' 8-1/2" long from the center of the antenna to a DPDT knife switch which is used to insert or remove a quarter-wavelength impedance transformer for 15 meters. This is simply a 10' 10-3/4" length of 450-ohm ladder line. Below the knife switch is a 1:1 bead balun and 50-ohm coax to the shack.

Mr. Griffith explains how to make the 350- to 380- ohm line from a length of 450-ohm line by bending the plastic between the "windows" so as to move the two wires closer together. He describes a forming jig made from a wooden plank a few feet long. He sets his saw-blade at a 75-degree angle from the horizontal and cuts two longitudinal grooves 1/4" deep so that they are 1/2" apart at the bottoms of the grooves, less at the tops.

To shape the plastic, he bends the plastic webbing into an inverted "U" shape and inserts one wire into each of the grooves, pushing it down until it bottoms at the base of the groove. This holds the plastic in place while he uses a propane torch to heat it. When the plastic gets soft, it releases the stresses that were caused by the deformation. After it cools, it maintains the bent shape holding the wires closer together and forming the lower impedance line.

Graphs are shown plotting the measured SWR on each band from 10 to 40 meters:

BAND Freq. SWR

40 7.0 1.5
7.3 1.8

20 14.0 2.0
14.25 1.1
14.35 1.5

17 whole 1.6 to 1.8

15 21.0 2.0
21.2 1.2
21.45 2.4

12 whole 1.4 to 1.5

10 28.0 3.0
28.8 1.2
29.2 2.8

The author further stated that, if the builder would prefer 30 meters over 15, the quarter-wave matching section could be cut for that band, instead.

Title>TA5:Under the Hood
Author>Newkirk, David - WJ1Z
Source>QST Sep 93, pp. 36-38
Abstract>Encourages amateurs to look inside their commercially-built rigs, and describes what they will see.

The author has written an article to encourage amateurs to open the cabinets of any commercially-built gear that they may have, and inspect the construction. This assumes that it is meant to be opened by users. Apparently many HTs are sealed, not to be opened except by the manufacturer's trained repair workers. Mr. Newkirk gives certain guidelines to help the user to identify what he is seeing.

PRODUCT REVIEWS (PR)

Title>PR1:Kenwood TS-50S MF/HF Transceiver
Author>Healy, Rus - NJ2L
Source>QST Sep 93, pp. 71-74
Abstract>Specifications and performance review of Kenwood's newest and smallest HF transceiver.

The Kenwood TS-50S is a new 100-watt transceiver designed for the mobile market and is the smallest such unit produced today. It is only 10.6 inches (27 cms.) wide, 7.1 inches (18 cms.) deep, and 2.7 inches (6.9 cms.) high; it weighs 6.4 pounds (2.9 kgs.)

It contains many, if not most, of the features common to its "big brothers", such as general coverage reception, dual VFO and split

frequency operation, AM, CW, FM, and SSB capability, band-stacking registers, QSK and semi-break-in CW, IF shift, multiple scanning modes, 100 memories, 20 db. attenuator, and "advanced intercept point", a technique first used in the TS-950S.

The TS-50S also supports multiple menu control features such as CW normal and reverse (that is, CW reception on your choice of upper or lower sideband, CW offset from 400 hz. to 1 khz. in 50 hz. steps, various tuning step sizes, display backlight intensity, and selectable RIT range (1.1 or 2.2 khz.). Options include a 500 hz. CW filter, two external antenna tuners, temperature compensated reference oscillator, computer interface, quick-release mounting bracket, and various desk mikes, speakers, and power supplies.

The ARRL laboratory made many tests to verify the manufacturer's claimed specifications and found most of them to be met in all respects. The reviewer found that the performance in use on the ham bands is very good in most respects and reasonably good in the rest. In his final summary he states that "the TS-50S packs an almost incredible amount of features and good performance in a package that fits inside a brief case. With few and minor exceptions it executes its functions well and gives no hint to your contacts that it is such a diminutive radio."

Title>PR2:M-Squared Enterprises EB-144 Eggbeater Antenna
Author>Ford, Steve - WB8IMY
Source>QST Sep 93, pp. 75-76
Abstract>Description and performance review of a 2-meter, crossed-loop antenna. It provides excellent performance in satellite operations.

The Eggbeater antenna is a 2-meter, crossed-loop omnidirectional antenna. It is made of two stainless steel wire loops about 34 inches in diameter, mounted orthogonally on a vertical fiberglass reinforced plastic (FRP) rod which is in turn mounted on a Delrin base. It produces an omnidirectional pattern that is horizontally polarized at the horizon, but above the horizon the pattern becomes right-hand circularly polarized (just what is needed for satellite operations).

The manufacturer's instructions state that if the Eggbeater is mounted ten to twelve inches above a metal ground plane, the circularly polarized lobe will be significantly increased; raising it to 40 inches above the ground plane will make a similar improvement in the horizontally polarized lobe.

In operation, the reviewer found that the Eggbeater made "a world of difference" in contrast to the vertical ground plane used previously. During a pass over by satellite RS-10, as it reached 10 degrees above the horizon, he was able to access it and hold its signal continuously until the end of the pass. Using his previous antenna he had always suffered deep signal fades at several points in a typical pass, especially when the satellite was directly overhead. During a VHF QSO party, he again found the performance to be drastically better.

In his summary, he recommended the Eggbeater as "an attractive alternative to a steerable beam antenna for 2 meters for anyone who does not have the room or the budget for the beam; in addition, it is the ideal antenna for a satellite beginner."

M-Squared Enterprises also makes Eggbeater antennas for other bands, including 70 centimeters. The company is located at 7560 North Delmar, Fresno, CA 93711.

HINTS and KINKS (HK)
Conducted by: David Newkirk - WJ1Z
Senior Assistant Technical Editor

Title>HK1:Steel-Wool Baluns?
Author>Maxwell, Walt - W2DU
Source>QST Sep 93, pp. 77-78
Abstract>Baluns made of steel wool, as per QST Nov 92, do not work as reported.

Digest>The Hints and Kinks column in QST, November, 1992, reported on construction of 1:1 baluns made of nothing more than steel wool packed around a length of coax cable in a manner similar to the way ferrite beads are strung. In this article, Mr. Maxwell reports on tests he made comparing steel wool with ferrite beads. Appended to the article is a description of a jig used to test the effectiveness of beads of unknown material, written by David Newkirk, WJ1Z, conductor of the Hints and Kinks column.

Mr. Maxwell found that the author of the original design report had made measurement errors and that the steel wool has no measurable effect at all in blocking antenna current from flowing on the outer shield of the coax. In other words, steel wool is no replacement for ferrite beads.

This finding does not negate the effectiveness of the steel-wool-on-unjacketed-coax device described in the ARRL Handbook as used in reducing r.f. radiation from coax lines due to conducted chassis radiation. In that case the steel wool is simply absorbing and dissipating the r.f., and there is no attempt to use it to isolate electrically the outside of the transmission line from the load being driven.

TECHNICAL CORRESPONDENCE (TC)
conductor: Paul Pagel, N1FB
Associate Technical Editor

Title>TC1:The REAL Si8901 Story
Author>Zavrel, Bob - W7SX
Source>QST Sep 93, p. 79
Abstract>Identifies the true designer of the Si8901 mixer IC.

Digest:The writer comments about the article: "A High-Dynamic Range Receiver Front End", by Jacob Makhinson, N6NWP in QST, February, 1993. In it, it was stated that the Siliconix Si8901 mixer IC was designed by Ed Oxner, KB6QJ. Mr. Zavrel corrects this by stating that he was the designer. Mr. Oxner performed most of the applications engineering on the chip, however.

Title>TC2:High-Dynamic-Range Receiver Elicits Comment
Author>Crawford, Mal - K1MC
Source>QST Sep 93, pp. 79-80
Abstract>Tests of the Makhinson High-Dynamic-Range Receiver described in QST Feb 93 find it to give the highest performance of any radio ever tested by the author. Also describes an improved test criterion for evaluating receiver performance, the "Receiver Factor".

Digest>In this letter, Mr. Crawford reports his findings about the performance of the receiver front end designed by Mr. Makhinson, referred to above. He finds that its performance is higher than that of ANY receiver he has ever tested.

To emphasize and explain his findings, he describes a new criterion of receiver performance that has been devised. It is called "receiver factor" (RF). It is calculated by subtractiing the noise figure from the input third-order intercept (TOI). This criterion overcomes the limitations of using TOI alone, which are severe, as he points out.

Using this new factor, he compares Mr. Makhinson's front end with the best commercial receiver yet tested, a modified Ten-Tec Argosy. The Argosy's RF was measured at +7.5 dB. whereas the Makhinson unit measures +26.4 dB!

The author goes on to say that the Makhinson design should be modified to add some protection for the crystal filter to protect it from damage to excessive input-signal power delivered by the post-mixer amplifier. He describes suitable protection and specifies at what point in the circuit it should be inserted.

In his last paragraph, the author states flatly: "The performance of Makhinson's receiver front end is unmatched by any commercially available Amateur Radio receiver or transceiver."

Title>TC3:Don't Forget ICP2!
Author>Wraight, Denzil
Source>QST
Abstract>Comments regarding the Makhinson High-Dynamic-Range receiver front end described in QST Feb 92. Shows that it requires careful balancing of the push-pull amplifiers.

Digest>This letter, like the previous ones, also comments about the Makhinson receiver article. The author refers to the fact that Mr. Makhinson used push-pull amplifiers, but did not make clear why they are balanced. Mr. Wraight points out that the push-pull configuration

reduces second-order intermodulation distortion (IMD2) by up to 40 dB., but only if the transistors are carefully balanced.

With low IMD2, the second-order intercept point (ICP2) can be expected to reach as high as 120 dBm. With signal strengths high enough to justify striving to get the very high third-order intercept that Makhinson achieved, careful balance in the amplifiers is essential.

NEW HAM COMPANION (NHC)

This is a regular section of QST, devoted to articles of primary interest to newcomers to amateur radio.

Title>NHC1:You CAN Copy 30 Words Per Minute
Author>Aurick, Lee - W1SE
Source>QST Sep 93, p. 60
Abstract>Amateurs can increase their code speed by: (1) Get on the air! and (2) Practice, practice, practice.

Title>NHC2:How Much Will It Cost?
Author>Ford, Steve - WB8IMY
Source>QST Sep 93, pp. 61-63
Abstract>The cost of equipment required to become active in any of the common specialties of amateur radio.

Digest>"Ham radio" is a catch-all description of many different hobbies, including HF CW/SSB, 2-Meter FM, Packet Radio, Satellite Operations, and others. The author answers the frequently-asked question: "How much will it cost?" to set up an average operating station for each of the specialties of ham radio, using all new gear.

Title>NHC3:The Joy of Building
Author>Gold, Jeff - AC4HF
Source>QST Sep 93, pp. 64-66
Abstract>The author's experiences, and pleasure, in building and operating several types of gear using kits.

Title>NHC4:The Doctor is IN
Author>Various
Source>QST Sep 93, p. 67
Abstract>Questions and answers of interest to newcomers to ham radio.

Digest>This is a regular monthly feature that answers questions frequently asked by newcomers. This month's column answers questions about packet bulletin boards; a problem of "jitter" in the image on a computer monitor; and whether music heard in the background while a ham is speaking into his microphone is a violation of the law.

Title>NHC5:Annie Get Your Gunn-plexer!
Author>Lau, Zack - KH6CP
Source>QST Sep 93, pp. 68-70
Abstract>Activities on the 10-GHz. (microwave) band.

Digest>This is a description of ham operations on the 10-GHz. (microwave) band which allows reliable communications over line-of-sight paths with relatively low cost, low power stations. The author describes a number of uses that hams are making of this band, including very high-speed data transmission, integrating separate repeaters over a wide area into one system, remote control of HF stations, and other activities.

RADIO TIPS (RT)

These are short items, scattered among the articles in the NEW HAM COMPANION section.

Title>Are You Overdeviating?
Author>Ford, Steve - WB8IMY
Source>QST Sep 93, p. 63
Abstract>FM operators must be careful to avoid overdeviating when transmitting.

When operating FM, the loudness of the audio modulation is represented by the bandwidth of the r.f. signal. Receivers are all designed to capture bandwidths up to 5.0 KHz., and reject frequencies outside that band. So if a rig is transmitting a signal wider than that, the peaks of the audio will be cut off, resulting in severe distortion. In this tip, all FM operators are cautioned to be careful not to overdeviate, or else they may find it impossible to work through certain repeaters, and be told in direct QSOs that their audio is garbled.

GENERAL INTEREST ARTICLES (GI)

Title>GI1:Pactor Phone Home: Mobile from the Australian Outback
Author>Mehaffey, Joe - K4IHP
Source>QST Sep 93, pp. 20-22
Abstract>A travelling ham reports his success in maintaining radio contact with home, using Pactor with a portable/mobile rig, while visiting Pacific islands and Australia.

Digest>This article reports the author's success in maintaining daily communications with his home station in Atlanta, Georgia, during the several week trip he and his wife took to two Pacific islands and Australia.

His home station is equipped with a 100-watt transceiver, TNC, computer, and a Yagi antenna on a 70-foot tower. With him on his trip, he carried a 100-watt transceiver, power supply, TNC, a rolled-up, multi-band trap antenna, a disassembled mobile antenna in sections, a VOM, and a set of hand tools, all packed in one side of a 27-inch suitcase!

Each member of his family left back in Atlanta has an amateur radio license. They, and some of his friends, were able to access the author's station equipment by a telephone link from their own home through a computer and modem. The station transceiver was programmed to switch automatically to 15 or 20 meters on a scheduled basis to coincide with forecast propagation changes. The antenna was left pointing toward Fiji Island during the entire duration of the trip.

The Mehaffeys stopped for several days at both Fiji and Raratonga Islands, where he operated as 3D2ME and ZK1IHP, respectively. Then they flew to Australia where they obtained a Holden station wagon and drove 2500 miles through the eastern part of the continent, including parts of the Outback. His call in Australia was VK2GRJ.

He was able to maintain reliable communications for up to eight hours per day almost every day from the islands and from the hotel where they first stayed in Australia, using the wire antenna which was put up in tall palm trees by nimble young hotel employees. More surprisingly, he found he could obtain nearly equal results while driving across the country using his mobile antenna.

Mr. Mehaffey credits his use of Pactor as his primary communications mode for much of the success of his links due to its ability to maintain reliable contact in the face of weak signals. His attempts at SSB contacts were not nearly as successful.

Clearly, K4IHP demonstrated that remarkably reliable communications were possible with only 100 watts at both ends and a good antenna at only one end, under the propagation conditions that prevailed at the time. The article does not state the dates of his trip, but presumably it was sometime in 1992 when HF propagation was still very good for long periods between the USA and Oceania/Australia.

Title>GI2:PSE QSL for 5BWAS!
Author>Kay, Leonard - p. 39
Source>QST Sep 93, p. 39
Abstract>How to achieve 5-band WAS.

The author specializes in contest operations and going for awards in his ham activities. The most elusive award given by the ARRL (measured by the relatively small number of hams who have earned it) is the 5-Band Worked All States award. Mr. Kay tells of his problems in earning it. He found that working nearby states on the higher bands is more difficult than getting the most distant states on the low bands. Sporadic-E propagation finally provided the solution.

Title>GI3:Reflected Waves
Author>Hanson, John - W9NBI
Source>QST Sep 93, pp. 42-43
Abstract>Ham radio in the immediate aftermath of World War II.

The writer was a GI in WW2 and ended the war in Saipan. He remained on duty there long enough to experience the return of U.S. amateurs to the air and used surplus equipment to open contact with stateside hams. When the time came for him to be returned for discharge, he found that he would travel on a merchant vessel. He was able to obtain permission to carry a ham rig aboard, and operate maritime mobile during the ocean crossing. This article recounts his experiences.

Title>GI4:First Contact and the Unpaid Debt
Author>Elliott, Jock - KB2GOM
Source>QST Sep 93, p. 44
Abstract>Helping newcomers get started with QSOs.

Digest>The author recounts his trepidation over his first contacts after receiving his license. He feels that he owes a debt to the kind consideration he received from the hams who were patient in "working" him and overlooking his clumsiness. Now he repays that debt by treating newcomers that he meets in the same manner.

>There's something wrong with "arrived"?

The truth of the matter is that people use this jargon to spice up the conversation...because, deep down, they know what they are saying has no informational value whatsoever. They want to sound like what they are saying has some substance to it - everyone else monitoring, knows otherwise.

Been there, done that. Verticals don't seem to work well in such a situation.
Most of your signal is striking the wet trees around you. The only decent
system I managed to get set up was a dipole stretched across a burned
clearing.

|> the National Audubon Society
|> the Smithsonian Museums

The League makes it a point of calling itself the representative of amateur radio in the US. The fact of the matter is that the people who have made a living off our your membership fee are more interested in propagating not what is good for amateur radio, but what is good for the ARRL.

In each of the cases you mentioned above, the respective groups are interested in propagating their own existance. And, there is nothing wrong with that fact; except, of course, when it comes to the ARRL. The ARRL in a sense serves two masters: their career employees, and the amateur radio community. More often than not the ARRL is going to adopt opinions on amateur radio that are in the financial best interests of the League - they have to, just as each of those groups you've mentioned above do - in order to survive as an entity.

To all radio amateurs

SB DX ARL ARLD028
ARLD028 DX news

The items in this week's bulletin are courtesy of Jerry, AA6BB/7, Bob, W5KNE, QRZ DX, Chod, VP2ML, The DX Bulletin, the OPDX Bulletin, the Yankee Clipper Contest Club PacketCluster network, Warren, NF1J, and Contest Corral from QST Magazine. Thanks.

NAURU. Ron, ZL1AMO, is now on as C21/ZL1AMO. Check the low end of 30 meters for him between 1045 and 1200z. Ron hopes to move on to Western Kiribati, T30, after this.

FRENCH POLYNESIA. Ron, N6VO, is now active from Tahiti as FO5VO. He prefers CW, so check the low end of the bands. He has been spotted on 14023 kHz around 0045z. QSL via N6VO.

CHINA. George, KA3NRG, is in Beijing on business for the month of May. His free time is limited but he will try to operate the ususal SSB DX frequencies as time allows. QSL via K3WS.

CRETE ISLAND. Julius, HA6NY, plans to be active on RTTY from May 24 to 31. Try 3582, 7038, 10185, 14085, 21085 and 28085 kHz.

YEMEN. 3Y0PI operator Robert, N4GCK, has received permission to operate as 7O0CW. He could be active as early as July, though news reports indicate that Yemen has edged toward civil war, with heavy fighting around Aden.

BHUTAN. Jim, VK9NS, has spoken with the Ministry of Communication of Bhutan and is awaiting permission to operate. Radio equipment and a beam antenna are already in place. He may operate from Bangladesh and Nepal enroute.

UNITED ARAB EMIRATES. At the Dayton Hamvention, Don, WB2DND, said he will return to the UAE in October and operate again as A61AD.

MARIANA ISLANDS. JA6VZB and JF6BCC will sign AH0T and KH2GR/KH0, respectively, from May 26 to 30. Plans are to operate 160 through 10 meters with CW, SSB and RTTY. They will participate in the WPX contest.

UGANDA. Jim, 5X1B, will be QRT sometime in May. After a trip home he will head for Cameroon.

ANTARCTICA. Due to budget cutbacks, the Vostok outpost, home of 4K1C, has been abandoned. The Vostok base holds the record for the coldest spot on earth, 129 below zero, reported on July 21, 1983.

ARMED FORCES DAY. In a change for this year, all Armed Forces Day military stations will be on the air during the 24 hour period from 1300z May 21 until 1300z May 22. This will give amateurs an excellent chance to make cross band contacts with these stations. A list of the military stations that will be active, their call signs, frequencies, locations and modes they will be operating appears in May QST on page 136.

PREFIX HUNTERS ALERT. CP94USA will be used by the La Paz Radio Club station CP1AA during May and June. From May 28 to July 28 Canadian amateurs may use the prefixes XK, XL, XO and VG. Nine Spanish stations will be signing EG as a prefix, 1 through 9 as a region designator, and ITU for the suffix, on ITU Day, May 17.

PETER ONE QSLS. QSL Manager Jerry Branson, AA6BB/7 reports that over 90 per cent of 3Y0PI QSLing is now complete. They began on 2 May 1994 with the first group going in the mail on 9 May 1994.

THIS WEEKEND ON THE RADIO. The ARRL Spring Sprints for 902, 1296 and 2304 MHz are separate sprints but will run concurrently from 6 AM to 1 PM local time. Work any five consecutive hours during the contest period exchanging grid square locations. Complete contest rules appear on page 120 in March QST.

The A. Volta RTTY DX Contest, sponsored by the Associazione Radioamatori Italiani is from 1200z May 14 until 1200z May 15 on 80, 40, 20, 15 and 10 meters. Work stations once per band exchanging signal report, serial number and CQ Zone. Details are on page 114 in April QST.

The CQ-M Contest, Peace to the World, sponsored by the Russian Amateur Radio Union and the Krenkel Central Radio Club of the Russian Federation is from 2100z May 14 until 2100z May 15 on 80 through 10 meter CW and phone. Exchange signal report and serial number. For more information see page 114 in April QST.

>what is good for amateur radio, but what is good for the ARRL.

What is good for amateur radio depends on a particular viewpoint, and the ham radio community is hardly homogeneous. No-code techs would like their privileges expanded while some extras would like the same privileges shrinked. Technical types want more projects in QST while casual operators would prefer more reviews and general stories. Repeater owners would like their frequencies protected while others feel that no one owns any frequency. ARRL is there to find a consensus, or if this is impossible but a decision is needed, take a stand. There is a saying that you can't make everyone happy all the time, and surely you will find dissatisfied people in any organization. This is not to say that ARRL is perfect, but IMHO its general line is good for amteur radio.

>easier to automatically turn it on if the recalled memory requires a PL tone
>on xmit? Can the HT still do that? How?

It will. You can program the PL tone into memory when you program that particular memory channel. While in vfo mode, key in the frequency, offset, etc. and turn on and set the PL tone as usual. Then you program the frequency into the memory. The PL tone should come on automatically whenever you recall the repeater from memory. I'd tell you which page number this is on in the manual, but I can't find the manual...

I hope this helps.

2050. WWW and Gopher request for BARC FTP site

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-13 16:04:39 UTC
From: wy1z@bach.coe.neu.edu
Message-ID: <WY1Z.94May13120439@bach.coe.neu.edu>
Source record: 267106
Cross-posted to: rec.radio.amateur.misc,rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

Many people have set up World Wide Web, Gopher, and other systems
which have pointers to the Boston Amateur Radio Club's FTP area.

This is very much appreciated.

Problem is, some of these pointers still point to the club's old location of
world.std.com, now known as ftp.std.com.

Could the people who maintain the WWW and Gopher systems (and others I am
not aware of) please make sure your pointers for the BARC's FTP area point
to oak.oakland.edu, /pub/hamradio directory.

Otherwise, those who wish to access the site will not be able to with the
present configuration.

Thank you very much.

73,
Scott

2052. Re: MultiBand Quads-Which One?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-13 16:47:07 UTC
From: szb50@ccc.amdahl.com
Message-ID: <1994May13.164707.14017@ccc.amdahl.com>
Source record: 267121

I can recommend the LIGHTNING BOLT Quad,address mostly in
the small ads of QST (Volant, PA).
1. Same basic materials and construction as GEM Quad for the arms, but
far easier to build, almost a one-man job building and erecting.
2. Aluminium wire, no soldering involved, driven element wires connect at
terminals of balun provided.
3. Ease of construction and erection..... each element separately made up,
boom is attached to top of tower, slid along so one end is close in,
director bolted to 8 foot boom, boom next slid along to bring other end
close to tower, driven element hauled up and bolted, coax with PL259
screwed into balun, boom centred.
4. A single U-shaped stub is adjusted for F/B ratio on each band.
5. *** 5 bander *** NO COMPLAINTS and many thanks to the W2 who
strongly recommended me to go for one. Review in either QST or CQ
some time last year.

In article <2qule6$6o3@blitzen.cc.bellcore.com>,
karayan@blitzen.cc.bellcore.com (karayannopoulos,george) writes:

[how do I set up the PL tones in memory so they work? }

Each memory can have its own PL tone associated with it... both for recieve and for transmit. You set these tones thusly: Tune to tne memory channel you want to set, and press F-Mset. Press ^SC to get to the PL section, and rotate the tune knob to set the frequency. Tc is for transmitted PL (what you need to activate the repeater) and Rc is for recieved PL (if you want to set PL squelch on your HT) You can set a different PL for each. I assume you know this much and have gotten this far....

The next step is to be sure that PL is active on this particular memory channel. To do that, again, tune to the memory channel you want to set up, press F+T-Sql to activate the PL (you've gotten this far too, I think), and then, the kicker... press (and hold) F+M-WR to lock this into the memory. You must hold it down for at least one second. (The HT will give a double beep)

Now, whenever you tune to that channel, the PL will not only be in memory, but will also be active. :)

This comes from Pg. 20 and 21 of the manual. Here's something that isn't in the manual... when you want to scan, but there's one channel you want to elimiate from your scan, you can "erase" it from memory using F+M-CLR. THis really only hides it, it doesn't erase it. When you want it back, tune to that channel and press F+M-CLR again... your channel is restored... with all its settings. :)

I like the RS unit... and for the price you can't beat it! (I only with it had more memories and higher audio in the built-in mic - something that can also be adjusted if you want to open it up - I'll wait until next year when the warranty expires)

If there *are* any citizenship requirements, then I, for one, am in *BIG*
trouble :-)

Fundamentally, the requirements are:-

* Musn't be an employee/agent of a foreign government
* Must have a mailing address which 'regular' US Mail
can deliver to.

Apart from that, no problems.

If you expect to be able to receive (and transmit) across the entire
window from 420-450 MHz without continually retuning the cans and still
get any worthwhile attenuation starting at 450, you need to review
the concept of quality factor, or "Q" one more time. Even if you are
willing to accept a 3 dB insertion loss and need only 20 dB
attenuation of the garbage starting at 450.50 and 30 dB at 451.00,
you won't find any device on the commercial market that meets those
specs for less than a five figure price tag, if at all.

Even "THE radio company" doesn't charge that much, but they also don't
expect a 30 MHz wide passband with 100 kHz skirts for cutoff. Maybe
what you really need is the Maxon "No-Tune Tuner."

And if nothing else, it falls back upon each ham to just
LISTEN for a while instead of just turning the knob and punching
the mike button immediately upon arriving at a given spot....

I have to agree with Derek in large part here. It is easy
for any ragchewer to QSY a few KHz as needed. But a previously
advertised operation needs to stay where it was advertised for the
sake of having people be *reasonably* able to find them.

IMHO, any individual ham with X range of frequencies
that tries to claim Y single frequency as being his absolute domain
is being a serious A hole if he isn't actually using it.

But then as a previous poster pointed out, there seems to
be a lot of that A hole mentality these days....

> Whether this is what the original poster is thinking of, I have
> no idea, but outright condemnation of DXers for wanting to keep

> one frequency per band clear for their sport is not warranted.
> It's a little like claiming that it's OK to park right next to
> a fire hydrant because there hasn't been a local fire for the
> last 5 minutes.

Or perhaps like claiming that its OK to park next to the
fire hydrant in spite of the fact that the store is closed and the
lot is empty......AND there hasn't been a fire in the last 5 minutes. :-)

****

Another beef of mine is when a reasonably well-established net
that advertises its meeting frequency comes on the air and someone
is on the frequency who, in spite of being politely asked to QSY,
will NOT do so. It is far easier to move a 2-station QSO than a
50-station (or more) net. The inconvenience of trying to have late
checkins go hunting should be considered as well, but of course,
the bozos who "own" the frequency couldn't be troubled to think about
that, could they?

I guess it all just boils down to the need to have folks
THINK before they REACT.

I have been receiving some automated/computerized transmissions on 154.46 MHz. They must be coming from several locations due to different RF signal levels I'm picking up as various transmitters turn on and off. The audio sounds like very slow AFSK modulation using different tone groupings. It appears these different transmitters/?receivers? can talk back and forth with each other. Kinda sounds like pidgeons cooing at each other. :)

Does anyone have an idea what I might be listening to.

David Checkett - WG0Y, St. Louis, Mo. check@vitek.com

I am eight days away from our local HAMFest and I plan to buy a dual band
2m/70cm HT in the $400 price range. In researching, I have been leaning
towards the Yaesu FT-530, but there are several around the same cost.

Alinco DJ-580T
Kenwood TH-78A
Standard C178A (new assumably to compete in the $300-$400 range)
Standard C528A (costs more)

I would appreciate any opinions (pro or con) about these radios. Thanks...

Tell that to the Ham in California who had his equipment confiscated (with the
tacit approval of the FCC) when he used a 2M HT on a Public Safety frequency
to call in Emergency Medical assistance, after other methods of communications
failed (ham, Cell Phone).

Perhaps it is the Tornado sirens in your local area communicating with
each other. It's a wild guess, but that's my suggestion.

2068. "Sacred Frequencies"

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-13 20:24:28 UTC
From: CS-ERH@nich-nsunet.NIch.EDU
Message-ID: <MAILQUEUE-101.940513142428.480@nich-nsunet.nich.edu>
Source record: 266989

I noticed a few of you talking about "sacred frequencies" and the like. Here is another one for you:

In January this year a few of us had an "IOTA EXpedition" to a local island. I did most of my operating on 15 mtrs. The other station operated 20. Every time he would ask on the "sacred" IOTA freq of 14.260 if the frequency was in use, he would get a "yes it is". But the fact is that the police were holding the frequency for a more important IOTA that never showed up on the frequency for the whole weekend. Therefore, we had to look for a clear frequency which was not too easy to find on 20 (gets like that sometime). If we were fortunate enough to find a clear frequency it most often fell a distance from the designated IOTA frequency and cost us much time lost in our searching. I guess that being the good guys we were, we just took it in stride and moved... It's a little agrivating when you invade a sacred frequency and will be asked to move but it is another story when told that the frequency is in use and is being held for a station that never showed up!!! This time we did what we thought was right. Next time we might fire up the 4-1000 and beam and "take" the frequency we deserved for our operation and efforts in advertising our Expedition...

Open for any comments.....

Is the FCC really ignoring complaints from the fire/police service about wilful interference? It appears the FCC needs a plexiglass window for their stomach if this is the way they are responding to the situation. Mayhaps they have not had any input from the police or fire agencies and have amateur complaints simply on <circular> file.

I cant believe a call to an FCC field office by a department official would not yield some kind of assistance. In the Stockton, Ca area police responded to a person who had found an HT for police or fire freqs and began causing trouble by calling the local radio club for DF help.

You might try to stir up the local agencies about talking to the FCC in person about this. It also pays to have a local club who has contacts with agencies, this helps to provide a 'public service' face for ham radio and maybe collect a few 'markers' on the way :)

Good luck.

> to CQ and QST. If I didn't know about it...

Well, if Roger doesn't know about it, that isn't because he wasn't told by the publications he claims to read. The ARRL has mentioned the "international DX calling frequencies" in QST, and CQ has also, but they pretty much assume that most hams already know it.

The "standard" DX frequencies are well known to all serious DXers, and have been for years. I figured most of them out anyway just by listening, before I happened to see them mentioned. Every major DX-pedition publishes in advance the frequencies they plan on using, and generally they select the "standard" frequencies because they are known and respected worldwide.

There are also standard calling frequencies for "Ten-ten Inter-natioal," for the County Hunters, for the IOTA fans, for the Marine Nets, for QRP and SSTV, for 6 meter DXers, and so on. These are also widely circulated.

Of course, if some jerk insists on sitting on a DX frequency and rag chewing when the band is open, most DX stations will move up or down slightly to avoid the conflict, but in many cases the DX station won't be able to hear the rag chewer and so will go ahead and transmit on the usual frequency--this is particularly true of DXpeditions like 3W0PI which published their frequencies weeks in advance, ran wide splits because of the pileups, and were insensitive to stateside East/West propagation (which was perpindicular to their operating path).

>organization. This is not to say that ARRL is perfect, but IMHO its
>general line is good for amteur radio.

You are absolutely right in your assesment of the difficulties the ARRL faces
every day. Where I differe somewhat is with the interpretation of what they
should do. Instead of trying to find a consensous in everything, they should
try to make goals and show some form of vision for amateur radio into the 21st
century. This is the point that Gary C. has been trying to make for some time
now. I am beginning to agree with him :-)
The only problem is that they also need tokeep their numbers high enough to
support their projects. And deciding they want to start taking a lead in
anything controversial (ending incentive licensing, easing CW requirements,
or shifting vhf to digital voice) will lose them some members. They are
therefore stuck in a quandry. Between being SOA or trying to keep ALL their
members happy. They seem t oconsistently choose trying to keep everyyone a
little happy instead of ever taking an unpopular but necessary stand. That is
one reason packet still sucks for the most part, ir there was a big push to
change the current packet system a lot of TNC's would be suddenly useless.
But we could provide a much better service to hamdom as well as emergency
services.

cheers,
Dan

Don't we all like the saying 10 meters is dead. And then another poerson says it isn't. Well I don't know about the rest of you in the US/World, but I boosted my WAS total from 18 to 26 in one evening! That was last weekend and it seems to be the same this weekend. (Or atleast what it sounded like when I got home from school today). I have been licensed for 4 months now and this week was the first time I heard Marryland, and now thats all I hear. :-)

Anyway if any of you need Iowa, I love to QSL and thanks to all the good hams who reply to mine I send out.

SB DX @ WW $RTDX0513
VK2SG RTTY DX Notes, 13 May
VK2SG RTTY DX Notes for week ending 13 May 1994 (BID RTDX0513)

By the looks of the bands, everyone has gone out to play golf or
tennis or something, because there have been few stations on the air
in the past week. Maybe they have been checking their gear for the
A. Volta contest this weekend.

Our thanks this week go to ZS5S, W2JGR, WB2CJL, J28JJ, DL6ET, DJ3IW
and the Central Eu. Dx Cluster node DB0SPC, I5ICY, IK5AAX, IK5PWJ
PacketCluster and the NJ0M node of the TwinCities.

Bandpass:

Notes of Interest:

ALBANIA ZA. Zdeno, OK2PZW will active during the CQWW WPX CW Contest May 28 and 29. Before the contest he will be active as ZA/OK2PZW on CW/SSB and RTTY, all bands with only 10 watts.

RARE RTTY ACTIVITY. For what happens this week in the Yemen area we lost a chance to put this rare one active on RTTY. We were trying to set up digital activity as Jacques, J28JJ had possibility to travel there. How long will we have to wait now? If hopes for 7O are gone at the present, other countries are still waiting to return active on RTTY. For example Libya, 5A. The last and only RTTY activity from there was in May, 1965.

GUERNSEY GU. DC9KZ, DL9YAJ and DL6ET will be active for about 3 weeks starting June 1 using each call GU/. Modes include RTTY. QSL via

bureau to the homecalls.

TONGA A35. Look for Paul, KK6H, active from the shack of A35CT til June 4.

P5RS7 Update. The ARRL received further documentation from the operation. When papers are translated from the original language (Korean) the investigation will begin.

Send your bandpass and notes for next week's bulletin to Bob, WB2CJL @ W5KSI.#NOLA.LA.USA.NA or to WB2CJL @ I5FLN.ITA.EU.

I might have some data on the 71-A in my files somewhere. It was a power triode, but only about a half Watt or so. Originally intended for battery or farm radios, most often in push pull as the audio output stage.

I have an interesting collection of old catalogs and data books, not the least of which is several years' worth of the RCA Receiving Tube Manual.

You know, when you get right down to it, it doesn't matter what you guys think about this issue of "reserved for DX (or anything else) freqs. The real issue is the fact that most hams don't know anything about these pompous "reservations" and use the freqs at will. Nothing the DXers can do about it except be rude. And for the minority of DXers who do choose to be rude (and most don't), well, life is full of rude people.

Ask if the freq is in use, and if not, cq away! :-)

Tim Rhodes (rhodes@rhodes) wrote:

: I am eight days away from our local HAMFest and I plan to buy a dual band
: 2m/70cm HT in the $400 price range. In researching, I have been leaning
: towards the Yaesu FT-530, but there are several around the same cost.

: Alinco DJ-580T
: Kenwood TH-78A
: Standard C178A (new assumably to compete in the $300-$400 range)
: Standard C528A (costs more)

: I would appreciate any opinions (pro or con) about these radios. Thanks...

Well, my vote is for the 78A. I have sure enjoyed mine. Every feature
you could ask for, a very nice package, and a solid track record.

All the HTs you mention are ok.

BTW, the Yaesu 530 is worth considering, although I still say the 78A is a
better radio.

2081. FCC/VE exams overseas - problems?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-14 02:40:09 UTC
From: slay@netcom.com
Message-ID: <slayCpru2x.Dty@netcom.com>

Potential flaws in the VE Exam system??

A question was raised recently as to whether or not non-citizens of
the USA are eligible for US ham licenses; they are. The question
reminded me of one of the peculiarities of the current VE system.
The bottom line is that it seems possible for the following to occur:

1. US exam sessions can and do occur outside of the USA.
(i.e. out of direct US legal jurisdiction)

2. The "question pool" can (I think) be translated into a foreign
language (i.e. non-English). I see no requirement that says
the language of the exam MUST be English, nor that any translation
MUST be certified or accredited by the VECs or the FCC. The
requirement "may" exist, but I haven't seen it, yet.

3. "Accredited" VEs can be non-US citizens/permanent residents.

4. Applicants can be non-US citizens/permanent residents.

5. Successful applicants can receive US licenses without ever once
setting foot on US soil; that is, being directly subject to US
legal jurisdiction.

Question: How many other countries in the world would permit foreign
nationals, on foreign soil, to administer exams for amateur licenses
(or any other license) in, potentially, a foreign language without
the requirement to have "approved" translations? Think of it. There
is absolutely nothing that the FCC nor the US law enforcement or judicial
system can do .... except maybe revoke somebody's license. No penalties,
no potential jail terms, etc.

Discussion:
BEFORE anybody gets excited and thinks I am xenophobic on this, I'm just
raising the subject as a matter of "potential" abuse. I have coordinated
quite a number of ARRL/VEC test sessions in Japan - and yes - I've also
used a Japanese VE. (Never mind that this fellow is/was also instrumental
in facilitating "reciprocal licenses"). And, my XYL took the exam (not
from me) even though she was/is not a US citizen nor permanent resident.

I am also aware that in Europe CEPT licenses are available to citizens
(and maybe others?) of the European Community to operate thruout the EC.
That's NOT exactly the same as having Germans giving exams in Germans
for individuals to receive FRENCH operator/station licenses, is it?

Another point is that in some countries (i.e. Japan), a Japanese citizen with an Extra Class license from the USA will be automatically eligible to receive a 1st Class Japanese license ..... even though the Japanese exam is considerably more difficult from both the technical AND CW requirement perspective. So, a situation can/may develop whereby JA operators (among the finest in the world, I might add), may flock to VE sessions in Japan and sign up for calls in KH6, KH0, KH2, etc. This is not altogether bad ..... but there has been some discussion of late concerning "Vanity Calls" in the USA and how residents of Hawaii have discovered that all the "prime" extra class calls have been allocated ... .. and many of those to non-Hawaii residents (mainlanders and foreigners).

My personal perspective is that reciprocal licensing should be made as "universal" as possible. I would much rather be JA1/WA6BXH rather than the fairly unique 7J1ABV - which also is distinctive to foreign hams only. However, there is a certain amount of appeal and prestige felt by many hams overseas (this I KNOW) who take great pride in collecting the wallpaper (foreign license) that they will never actuallyl use.

Is this a problem? Should anything be done about it?
I raise the issue simply as a discussion topic. I am not necessarily advocating a particular position, nor am I offering a solution (yet).
I am just curious to see if there is any interest in the topic.

> If so, does anyone know the phone number of the nearest office
> in the Phiadelphia area?

Gettysburg is the only office to get them from, generally. Don't have
the number handy, but information can give it to you. There's a FCC
Field Office at 2300 E. Lincoln Hwy, Room 404, Langhorne, PA that
covers the Philly area. Your best bet for getting one fast, though,
is to ask the ARRL to send you one.

>Where have all the sunspots gone?

On vacation; they'll be back in '98 or so. <g>

NOTE: The Effective Sunspot Number for 12 MAY 94 was 11.8.
The Full Kp Indices for 12 MAY 94 are: 3o 3+ 3o 2o 1+ 2o 2- 3-
The 3-Hr Ap Indices for 12 MAY 94 are: 15 19 16 9 5 7 6 14
Greater than 2 MeV Electron Fluence for 13 MAY is: 2.7E+09

SYNOPSIS OF ACTIVITY

Solar activity was very low. Only a single B5/SF flare
in spotless Region 7719 (S07W56) with an associated small
disappearing filament was noted. Region 7722 (N07E52) grew
slightly but remains magnetically simple. Regions 7724
(S06W10), 7725 (N06E25), and 7726 (N08E65) were numbered today.

Solar activity forecast: solar activity is expected to be
low. Region 7722 has the best chance of producing C-class
activity and a very slight chance for an isolated M flare.

The geomagnetic field has been at quiet to unsettled
levels for the past 24 hours. The energetic electron flux
(GT 2 MeV) remained at high levels.

STD: Overall fluence levels for greater than 2 MeV electrons
were very high.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet to unsettled for the next 12 to 18 hours,
becoming unsettled to active thereafter due to a well
positioned coronal hole.

Event probabilities 14 may-16 may

Class M 05/05/05
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 14 may-16 may

A. Middle Latitudes
Active 40/25/25
Minor Storm 20/25/20
Major-Severe Storm 10/15/10

B. High Latitudes
Active 20/25/25
Minor Storm 20/20/20
Major-Severe Storm 20/25/25

HF propagation conditions were normal over all regions.
Reports of sporadic-E have been noted for some low latitude
stations affecting frequencies as high as 20 MHz from a few
minutes to several hours. Minor signal degradation may return
to the high and polar latitude regions over the next 24 to 48
hours. Otherwise, near-normal propagation should persist.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

** End of Daily Report **

>The site stores the FCC's daily, digests, public notices etc.

You can also reach it by Gopher (gopher fcc.gov), but they tend not to update the gopher menus as frequently as they add files, so you may miss some interesting information if you rely exclusively on gopher.

>The FCC plans additional services as the host is developed.

One of the future services they promise is a mailing list so that at least some of the files can be accessed via email. Until they get that running, I am providing a finger service whereby you can obtain the current day's files from fcc.gov by simply fingering my account:

finger rjk@telcomlaw.com

(Note: In issuing this command you may want to turn on your capture buffer or redirect the output to a local file as the .plan file is many screens long. Those who do not have finger capability can use one of the several email finger servers. For example, address an email to:

jfesler@netcom.com

with the following in the subject line:

#finger rjk@telcomlaw.com

and you will get back an email containing the current day's fcc materials. I attempt to update the file each business day between approximately 11:00 am and 3:00 pm.

Enjoy!

BR>The "standard" DX frequencies are well known to all serious DXers,
...
BR>There are also standard calling frequencies for "Ten-ten Inter-
BR>natioal," for the County Hunters, for the IOTA fans, for the Marine
BR>Nets, for QRP and SSTV, for 6 meter DXers, and so on. These are
BR>also widely circulated.

These standard freqs are widely circulated? I bet if someone is looking for a particular standard freq because they are interested in participating (fans) they will find it. For instance, I easily 'found' out where the SSTV freq 14.230 was, because I was *looking* for it.

How bout including in your message the other widely published freqs that I might not be looking for but would rather not step on?

Thanks in advance.

Barrie Britton (britton@epsilon.llumc.edu) wrote:

: Well, if Roger doesn't know about it, that isn't because he wasn't
: told by the publications he claims to read. The ARRL has mentioned
: the "international DX calling frequencies" in QST, and CQ has also,
: but they pretty much assume that most hams already know it.

"Claims to read" huh?

Well, sorry chum, but despite having been reading both pubs, I never heard of all these screwy special freqs. And whether you like it or not, most other hams haven't either. And when jerks get indignant when some poor fellow invades one of these "reserved" freqs, and chew on some hapless newcomer (which is the type of behaviour which started this thread in the first place) it is a discredit to the hobby. Simple as that.

When I took my Extra Class exam, I did learn about ATV, so I know what that sounds like on 20M at around 14230, so generally I steer clear of that freq unless I'm darned sure there's no ATVer out there. Just common courtesy. Ditto nets. If some chap breaks into a qso of mine (happened a couple of weeks ago) and says that a net is about to meet on the freq we're using and could we move up or down a few Khz, well, that's OK with me too, unless
I'm passing priority traffic.

: The "standard" DX frequencies are well known to all serious DXers, : and
have been for years. ....

Well, that's nice. But most hams aren't serious dxers, and skip over the boring articles in QST and CQ on DX. If you like DXing, great! For me it's a bore unless it involves a ragchew. But don't expect casual amateurs to get excited about arcane rules and conventions of this dx passtime in excess of normal rules of courtesy such as: "QRZ, is the frequency in use please?"

Frankly, for me amateur radio is a hobby, and it had better be a low-stress, enjoyable one, or I'll find a new hobby.

Fortunately, corteous amateurs vastly outnumber the few territorial lids, and for the last 28 years I've found the hobby to be a pleasure.

: There are also standard calling frequencies for "Ten-ten Inter-
: natioal," for the County Hunters, for the IOTA fans, for the Marine
: Nets, for QRP and SSTV, for 6 meter DXers, and so on. These are
: also widely circulated.

Never even heard of 'em. Ten-ten International? You've got to be
kidding. They've got a special freq too, hey? How about the cub scouts?

OK, just kidding, but you can see where this leads.

> enough in number and well-enough known by most hams that it
> is courteous to avoid those for casual operating when possible.

DX newsletters are read by DX'ers. As I'm not one, I don't read them. As I'm on hf only occasionally (usually schedules with friends), I do not know everyone's special frequencies - in spite of the fact I was originally licensed back in 1988. So.... a little courtesy, ON BOTH SIDES, will go a long way. Hey, DX'ers! Don't just assume that the guy who shows up on freq. is a discourteous lid trying to assert his right to be anywhere he wants. You may find, if you're nice, that he is an advanced or extra who spends most of his time on satellites or being the trustee of a repeater for the folks in his area. You might find that, if asked and educated, he would be happy to move 5-10 KC to accomodate a reasonable request, reasonably made. "Hey you jerk, get the f*** off the (insert your favorite special interest here) calling frequency" is most certainly _not_ a reasonable request, made in a reasonable manner. When folks come up on the WA3NAN shuttle retrans freq, a polite informative approach works for me >95% of the time. Usually, they don't know about it. Think about how many times you look on the packet board and see:

ALL @WW SHUTTLE FREQ WANTED

Those freqs are much more often published than most others. Anyway, 'nuff said.

73 to all de John, N4XAN

No, it's more like claiming no one else should drive down the road
because the fire truck might need it. If no one else is using the
frequency at the moment why shouldn't someone else use it? Most people
will give up a frequency to a net if asked nicely.

It's a little over the top to expect everyone to know all the net
frequencies in use by every group on the air, obscure or not. A little
courtesy goes a long way.

2103. Archive: NRE Test Center Managers List

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-14 21:10:05 UTC
From: modena@sunSITE.unc.edu
Message-ID: <2r3end$sju@bigblue.oit.unc.edu>
Source record: 267019

Newsgroups: rec.radio.amateur.misc
Subject: Archive: NRE Test Center Managers List
Summary:
Followup-To:
Distribution: na
Organization: University of North Carolina, Chapel Hill
Keywords:
Cc:

For those interested in testing for a Commercial Radio Operator License

Version 1.0.0 -- 14 May 94

There are eight organizations authorized by the FCC to conduct examinations
for various commercial radio operator licenses and endorsements.

The W5YI-affiliated National Radio Examiners (NRE) maintains a list
of Test Center Managers, sorted by ZIP code. I have reproduced a
recent list, posted separately and periodically on Usenet--and
maintained in a public access archive (SunSITE.unc.edu).

This posting details how to read or retrieve the listing of NRE Test
Center Managers via:

1. FTP-email (for those with email only)
2. FTP file retrieval
3. TELNET to a GOPHER server
4. Pointing your local GOPHER/MOSAIC/WWW client

1. FTP-email (for those with email only)

If one has only email access to the internetworks, one can use the
services of an intermediate to obtain a document from an ftp archive.

To more fully understand the nature of the free service of an inter-
mediate, send email to: ftpmail@decwrl.dec.com; the body of the message
is the word "help"...by return email, you will receive a complete
explanation of the free service.

To retrieve either a plain ascii text version or an PostScript(R) version
of the NRE Test Center Managers list....

Send email to: ftpmail@decwrl.dec.com
Leave the "subject:" blank.
Here is the exact message to send:

connect sunsite.unc.edu
cd /pub/academic/agriculture/agronomy/electronics+computers/colem

```
get nre-9404.txt
get nre-9404.ps
quit

The last line of the email message MUST be 'quit'!!!

'nre-9404.txt' is the plain ascii text versions of the NRE Test
Center Managers List.

'nre-9404.ps' is the encapsulated PostScript(R) version of the NRE
Test Center Managers List

Leave out one or the other line according to your need.

You will receive a reply from the intermediate telling you where your
request is in the queue and advising that service may take a while.
Probably the reply will process overnight, but if it takes longer...

2. FTP file retrieval:

FTP to sunsite.unc.edu (198.86.40.81}
Login as anonymous
Give your TPC/IP id as the password

>cd /pub/academic/agriculture/agronomy
>cd ./electronics+computers/colem

For a plain ascii text version of the Test Center Managers,
"get" nre-9404.txt

For a encapsulated PostScript(R) version of the Test Center Managers,
"get" nre-9404.ps

3. TELNET to a GOPHER server (an example session)

>telnet sunsite.unc.edu
Trying 198.86.40.81 ...
Connected to sunsite.unc.edu.
Escape character is '^]'.

emd@ham.island.net says:

>>It's a little over the top to expect everyone to know all the net
>>frequencies in use by every group on the air, obscure or not. A little
>>courtesy goes a long way.

The point of my original posting was nothing to do with nets,
obscure or not. I merely pointed out that 14195, 21295 and
28495 are internationally-recognized spots for DXers to gather.
Major (and minor) DXpeditions regularly use those frequencies,
and if you are going to call "CQ Ragchew" somewhere between
14190 and 14200 I am suggesting that you don't do it on 14195
unless you are being perverse. If a DXpedition comes on and
asks you to move, you have two choices - you can refuse to
because you were there first, or you can be friendly and move.
If you start a ragchew on 14192 you are not likely to be asked
to move, but if you start one on 14195 there is a bigger chance
that you will be, so why not recognize that 14192 is a better
place to start out?

I know about two net frequencies on 20m, I rarely use them, I
don't care for nets. But I would never start up a QSO on one
of their frequencies even if they are not operating right then.
This is what I would call courtesy before the fact. I suppose
my point is that once one has been told that 14195 is a DX
gathering frequency worldwide, it is combative to start a QSO
right there when there are other frequencies available.

Personally, I stay down in the cw bands most of the time and
avoid all this stuff.

Gee, Jim, maybe he's not a DXer. Or maybe he's not living in the USA and
doesn't pay attention to US bulletins. Those frequencies may be known to
you as "DX" frequencies, but for most of the rest of us, they're just
frequencies. Nobody "owns" a frequency, though it behooves all of us to
cooperate with nets that are scheduled for a particular time and freq.

Jeez, Jim, his comment was made as gentle satire. Don't you have a sense
of proportion?

If someone wants to hold a net on a frequency I am already using, and
they ask politely, they're welcome to use the frequency. Hardly anything
we do in ham radio save for emergency traffic is life and death stuff
anyway, and I sure don't mind.

On the other hand, those that insist people should get the hell off
"their" frequency will usually get what they deserve. The frequencies
don't "belong" to any group or individual.

```
Advisory on GOPHER-accessible archives of:

rec.radio.amateur.antenna

rec.radio.amateur.homebrew

QRP@Think.com

Subject-threaded articles from the above mentioned topics can be read
via GOPHER (and presumably MOSIAC and WWW). Individual articles can
be retrieved via the built-in email mailer (press 'm' to pop the menu).

One can assess these archives in one of two ways:

1. Via your local GOPHER client

2. Telnet to the public GOPHER server at SunSITE.

At the present time, simple FTP access to these archives is not possible.

1. Use the following profile to point your local GOPHER client to
the appropraite part of sunsite.unc.edu:

+---------------------------------------------------------------------+
#
Type=1+
Name=Electronics & Computers
Path=1/../.pub/academic/agriculture/agronomy/electronics+computers
Host=calypso-2.oit.unc.edu.
Port=70
Admin=Jonathan Magid and Simon Spero, 919-962-9107 <ftpkeeper@sunsite.unc.edu>
ModDate=Sat May 14 16:54:22 1994 <19940514165422>
URL: gopher://calypso-2.oit.unc.edu.:70/11/../.pub/academic/agriculture/
agronomy/electronics+computers
+---------------------------------------------------------------------+

NOTE: The URL: line was too long to send on Usenet. Join the line
subsequent to the URL: line back to the URL: line before putting the
profile item in your .link file.

The GOPHER directory will look like this:

>so steeped in red-tape it's not funny.

As long as your evidence is so solid why not go public? Send the details to your local newspaper and see if they write up a story, or at least send a letter to the editor. As long as you avoid direct accusations and instead use phrases such as ``...our evidence shows that the transmissions came from the residence of <whomever> at <whatever address>...'' you shouldn't encounter any legal problems; detail how the evidence was gathered, and mention the lack of action from the FCC.

At the very least let the offending operator know that you and many, many, many others know (safety in numbers!) of his illegal operations; maybe even send him a copy of Part 97 and list the dollar amounts of the fines he could receive. Advise him that your findings have been turned over to the federal government.

Others will say to avoid any contact with him but I've found that direct contact is a big motivating factor in the cessation of these kinds of activities.

I thought `non-profit' meant that at the end of the year an organization's income and expenses were equal, i.e., they broke even.

>If you have any doubt, open any issue of QST and count the number of ARRL
>publications. Books, study materials, code tapes, license videotapes, the
>list is endless.

I wonder how much it costs to produce all the above. Do you want them to just give these items away free?

You've been in academics Mike so you certainly know how much textbooks cost today - now compare those costs to the prices the ARRL is charging for their books (their QRP NOTEBOOK: $5 - pretty cheap!).

>The League may be "non-profit" from the viewpoint of the IRS, but its
>certainly not non-profit from the viewpoint of the staff members who have

>house, car, and vacation each year?

A non-profit organization's expenses include employee salaries. How those employees spend their salaries is their own business.

I'm sure the taxpayers of the State of Hawaii (they pay my salary, and this university is a non-profit corporation) don't mind that I've taken some of my earnings and bought a sailboat to live on.

I personally like the Standard series of radios, I use a Standard C520
(OLD!!!) and I have enjoyed it's use. I have used the C178A, and the C528A
and they to are nice radios.

The Alinco DJ-580T is also a VERY reliable radio, I have sold many of thse
radios during the past year and have always heard good reports from customers.

The Kenwood TH-78A tends to have (at least the ones I have used) problems with
Intermodulation.

As for the Yaesu 530T, this radio is a kick ass little radio, although it
tends to get Intermod on both VHF *AND* UHF.

2112. ISC revokes Amateur Licenses (addendum)

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-15 01:35:09 UTC
From: matthewa@icebox.iceonline.com
Message-ID: <CptLKI.Aqq@iceonline.com>
Source record: 267026

For those of you interested:

I have recieved a number of pieces of mail regarding the notices posted
regarding Industry and Science CANADA revoking ham licenses. Here is
a brief summary of what happened:

The two individuals, (Mr. JOHNS - VE7MCJ and Mr. Tierwel - VE7IOZ) had, in
there possesion, illegaly modified amateur radio equipment. This equipment
was used, by the two individuals, to cause substantial interferance to local
Police and RCMP departments in at least 4 municapalities in the Lower
Mainland, as well as many Amateur Radio repeaters. The two were caught in
the action of causing interferance to a law enforcement agency by ISC radio
inspectors and RCMP officers.

The temporary suspension of the two individuals licenses were only prelimenary
actions, and charges are pending. I have been informed that ISC/RCMP will
most likely request for maximum penalties against the two.

2113. Sell or trade

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-15 03:32:00 UTC
From: william.eckle@twb.com
Message-ID: <bd.8441.170.0NC144FB@twb.com>
Source record: 267027

I have for sale or trade two VHF mobile transceivers.

(#1) Icom-230, PLL, synthesized, 67 channels, 146 to 148 Mhz. This unit covers the bandwidth in 30 khz increments. This is the original band plan for 2 meter repeaters. E.g., 146.76; 146.79; 146.94, etc. The repeater offsets are -600 and +600khz. The radio also operates on any of the simplex frequencies, e.g.146.52; 146.55; 146.58 etc. The power output is 10 W. This unit features an analog type S meter. The radio does not have DTMF or PL (CTCSS), however there is a an accessory connector for 9V. power take-off and audio input. (I have used this for external DTMF and it works fine). The unit also has a jack for external speaker. Price is $100.00 OBO. (See swap info below).

(#2) Icom-280, PLL, synthesized, 559 channels. 143.9-145.995 Mhz in 5 khz steps. 146.01-148.11 Mhz in 15 khz steps. This is a later version than the Icom-230 for an expanded 2 meter band plan. The repeater offsets are -600 and +600 and the radio operates simplex on any of the channels. This radio has a dual power output selection of 10 watts or 1 watt. The frequency display is a 4 digit bright red LED type. This radio also has an analog type S meter, and a jack for an external speaker. Also featured is a 3 channel programmable memory. No DTMF or CTCSS. Price is $160.00 OBO. (See swap info below).

Both of the above mobile units come in factory boxes with manuals and accessories: mounting bracket; power cord; extra fuse; and hdwe. These radios are in good condition and I'll even pay the shipping!

I'll trade both of the above radios for a used dual band VHF/UHF radio such as the Alinco DR570T, DR592T or DR600T. (DR570T or DR600T preferable). Or if anyone has dual bander and doesn't want to trade, I'll offer cash. (The amount depending on condition, and if manual and accessories are furnished).

Please contact: Frederick Franz (WA6VHB)
1204 N. Ponderosa Circle
Payson, AZ 85541-3843
Tel.: 602-474-9647

Greater than 2 MeV Electron Fluence for 14 MAY is: 1.6E+08

SYNOPSIS OF ACTIVITY

Solar activity was at low levels. Region 7722 (N08E38)
produced a C1/1F flare at 14/0013UT with an associated Type II.

Solar activity forecast: solar activity is expected to be
at low levels for the entire forecast period.

The geomagnetic field has been at quiet to active levels
for the past 24 hours. Minor to major storm levels were
observed at high latitudes during local night time. The
energetic electron flux (GT 2 MeV) ramged from very high to

normal levels over the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be at unsettled to active levels, with minor to
major storm levels being observed during local nighttime due
to a favorably positioned coronal hole.

Event probabilities 15 may-17 may

Class M 05/05/05
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 15 may-17 may

A. Middle Latitudes
Active 25/25/20
Minor Storm 05/20/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

HF propagation conditions were normal over all regions.
Minor signal degradation is expected over the next 24 hours for
the high and polar latitude paths as levels of geomagnetic
activity become enhanced due to effects from a well placed
coronal hole.

All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep

V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

Sort-of; they're usually held in US possessions, such as a military base. And the exam results still have to go through a VEC that IS in the US, so they're not entirely out of US legal jurisdiction.

>

> MUST be certified or accredited by the VECs or the FCC. The
> requirement "may" exist, but I haven't seen it, yet.

The loophole here is that it must be a public question pool that's published before the tests. That would by nature include translations; the VECs can't give a translated test if it wasn't published beforehand.

>
> 3. "Accredited" VEs can be non-US citizens/permanent residents.

True.

The fault in this is that they MUST have a US address to receive mail; if they've never set foot in the US, they probably don't have a US address.

Actually, I don't see any (particular) relevance to *who's* legal jurisdiction
a VE session is held under. In the final analysis, the VE's are directly
answerable to their VEC, and also by definition to the FCC. Geography isn't
an issue.

> 2. The "question pool" can (I think) be translated into a foreign

Like yourself, I see no requirement for the exam to be in English. If that
were the case, all the question pools would be invalid :-)

> 3. "Accredited" VEs can be non-US citizens/permanent residents.

True. What of it?

> 4. Applicants can be non-US citizens/permanent residents.

True. What of it? Perhaps we should examine the motivation behind an
an application by a non-US citizen for an FCC Amateur license. It is my
understanding that a large number of these are, in fact, British. And the
profile of these applicants is interesting, too.

On the whole, they will have already qualified (some time ago) for either a
U.K. Amateur Licence 'A' or 'B' - with 'A' being roughly equivalent to
General, but also including a 12 WPM code sending test. The 'B' licence
requires the same passes in the written papers, but does not include any
code requirements. Nearly the same as a Technician, but not quite :-)

As you will know, on an annual basis, the U.K. exports quite a lot of a)
money and b) tourists to Florida and California (plus some other places),
and a number of these will be amateur radio enthusiasts, who would find the

availability of a dual band HT an useful asset on their trip(s) to the U.S.

All these folks have to do is to file a Form 610A and apply for a reciprocal permit (actually, it says an Alien permit, but we're fresh out of UFO's right now ...). The *problem* with that strategy is this: that permit is valid for one (rather than ten) year, and allows the operator privileges which he *would* have on his home soil, where these are less than or equal to those privileges available to an equivalent U.S. license class. For U.K. amateurs this means: 50-52MHz, 144-146MHz, *no* 220MHz, 430-431MHz, 432-440 MHz. I'm sure if you consider what these allocations mean, you'll realise that a reciprocal permit is in fact less than useful to a British amateur.

> 5. Successful applicants can receive US licenses without ever once
> setting foot on US soil; that is, being directly subject to US
> legal jurisdiction.

Yes, that can happen. but *why* would it happen? Let's assume that I have a desire to spend 3 months travelling the U.S. for a vacation. When I arrive, I'd like to buy an R.V. and install a mobile rig in order to chat to local folks whilst on my travels. Given the frequency restrictions (necessarily) imposed by the reciprocal permit, it would be really useful if I had a "proper" FCC license when I arrived on U.S. soil. Yes - I *know* that there are frequent walk-in testing sessions, but with the turn-around time at the VEC/FCC, and the fact that I'm (notionally) planning to be on the move the whole time, how do I obtain a license if I don't arrive with it already in my possesion?

> Question: How many other countries in the world would permit foreign
> nationals, on foreign soil, to administer exams for amateur licenses
> (or any other license) in, potentially, a foreign language without
> the requirement to have "approved" translations? Think of it. There
> is absolutely nothing that the FCC nor the US law enforcement or judicial
> system can do .... except maybe revoke somebody's license. No penalties,
> no potential jail terms, etc.

Well ... there is an interesting, if not contentious question! I can't speak meaningfully about the licensing strategy of countries other than the U.S. and the U.K., but .... The U.K. Radiocommunications Agency (FCC-equivalent) grants franchises for amateur licensing testing to "appropriate applicants". This is proably effectively an identical strategy to that employed by the FCC, who have seen fit (under their rule making processes) to grant a number of franchises to various VEC organizations. Here in the U.K., there are only two such organizations - the R.S.G.B. have the franchise for supplying Morse code testing, while the City and Guilds of London Institute have the franchise for the written testing. The result? On almost any given day, you could go somewhere in the U.K. and take a code test, with the proviso that you would *usually* be expected to book in advance (around one month). The written tests are a different, sad story. You'll need to book many months in advance, for one of only *two* (or is it three??) dates in the year, for a test at a restricted number of sites.

What would make life fun would be this: when the C&G's franchise expires, the ARRL (and possibly W5YI) ought to apply to take it over. As I understand it, the decision criteria is based only upon the suitablity of the examination syllabus. It is my belief that, on the basis of the VEC program's success, that the U.K. authorities might well be persuaded to adopt this approach.

> Discussion:
> BEFORE anybody gets excited and thinks I am xenophobic on this, I'm just
> raising the subject as a matter of "potential" abuse. I have coordinated
> quite a number of ARRL/VEC test sessions in Japan - and yes - I've also
> used a Japanese VE. (Never mind that this fellow is/was also instrumental
> in facilitating "reciprocal licenses"). And, my XYL took the exam (not
> from me) even though she was/is not a US citizen nor permanent resident.

Well, a story with a happy ending :-) I'm not a U.S. citizen. I am an ARRL accredited Extra Class VE. I took my tests in Rochester, NY. What is it about that you think could bring abuse into any test sessions at which I serve? In any case, I'm sure that the immigration folks whould take me to one side and attempt to hold a deep and meaningful discussion on the subject of any misdemeanours I may be accused of upon my arrival in the U.S. for one of my frequent business trips :-)

> I am also aware that in Europe CEPT licenses are available to citizens
> (and maybe others?) of the European Community to operate thruout the EC.
> That's NOT exactly the same as having Germans giving exams in Germans
> for individuals to receive FRENCH operator/station licenses, is it?

Actually, a CEPT license is more of a "reciprocal without paperwork" than what you've imagined. A few extracts from the rules, as applied to U.K. licensees:
"CEPT Amateurs shall comply with the terms of their CEPT equivalent licence, unless such compliance would result in a breach of the requirements of the United Kingdom."
and
"CEPT Amateurs who possess the equivalent of a CEPT Class 2 licence shall use only those frequencies above 144MHz ....."
and
"The licensee shall be a temporary visitor and non-resident in the host country ..."

I've already discussed the U.K. franchise situation. Let's put the boot on the other foot for a few moments. Here, the code tests are organized by the R.S.G.B., who have appointed a number of Senior Morse Examiners - one for each county (London is an exception - it is further divided into North and South). These folks are described as "Senior County Morse Examiners". The qualifications necessary for this "job" (it's a volunteer position ...) are simple: 100% copy of 5 minutes at minimum 20 WPM. 100% sending for 5 minutes at 12 WPM on a straight key. Applicants must have a suitable disposition towards their task and the test candidates. Morse examiners are not required to be British citizens. Morse examiners are not required to be British residents. Morse examiners are not required to hold an amateur radio license of *any* description. Morse examiners are not required to be members of the R.S.G.B. Simple.

Thereafter, it is the responsibility of the Senior County Morse Examiner to recruit and select appropriate "County Morse Examiners", according to identical selection criteria. In order to gain a "pass" for the U.K. code test, there have two be two examiners present, who must agree that you "made the grade". A simple, effective process. As you can see, the Senior County Examiner has a lot of latitude to abuse the testing process if he/she should desire to.

So ... where's this all lead? Up until a few weeks ago, one of our Senior Morse Examiners was an American citizen. He's now finished his assignment here in the U.K. and returned home. How do you suppose, in the event that we discover he had abused our system, we could hold him accountable? Well, we couldn't - simple as that. I'm not bothered, either. And I'm not bothered for these reasons:
* I can read and send Morse code far in excess of the requirements to be a U.K. Senior Morse Examiner
* I *am* a U.K. Senior Morse Examiner (adjoining county)
* I personally knew this chap, and trusted his integrity

> Another point is that in some countries (i.e. Japan), a Japanese citizen

> discovered that all the "prime" extra class calls have been allocated ...
> ... and many of those to non-Hawaii residents (mainlanders and foreigners).

But where are they going to use these KHx calls? I have zero idea of the license regulations in JA-land. But I do know that if I attempted to sign G/N2TLY, it wouldn't be long before the radio police jumped on me, asking to see my reciprocal permit. Of course, they will *not* issue reciprocal permits to British citizens ...

> My personal perspective is that reciprocal licensing should be made as
> "universal" as possible. I would much rather be JA1/WA6BXH rather than

> However, there is a certain amount of appeal and prestige felt by many
> hams overseas (this I KNOW) who take great pride in collecting the
> wallpaper (foreign license) that they will never actuallyl use.

I agree with your perspective. However, we are not even off of the starting grid yet .... CEPT, as I have demonstrated, is a paperwork reduction excercise rather than a universal license. I have a number of calls for different parts of the world. Each call I hold has been activated (at some time or other) in the country it was issued for. I wouldn't have it any other way - the associated paperwork and processes are just too difficult otherwise!

> Is this a problem? Should anything be done about it?
> I raise the issue simply as a discussion topic. I am not necessarily

> advocating a particular position, nor am I offering a solution (yet).
> I am just curious to see if there is any interest in the topic.

In my opinion, no, and no.

The joint services expedition to Ellesmere Island (VE8)
was due to reach its destination (80.38, 85.26W) on
14 May and to begin operation asap thereafter. This is
a scientific expedition with limited radio time, but
has beacons with 50018 or 50005 xtals with 15watts and
28192.5 with 28197.5 backup. Beacon pattern is 190 (short)
dots at 38dpm, followed by c/s de VE8RAF at 15wpm. Operating
pattern ODD dates 28MHz, EVEN dates 50MHz initially; daily
if power allows up to about 12 Aug.

Expedition has 50MHz transceiver; likely freq. not known. Grid
thought to be FQ12.

HF frequencies (cw) 3515, 7015, 10112, 14005, 18070, 21055. cw
preferred mode but may use 14142, 14290,21290 ssb. Callsign
VE8RAF, operator G0BHA.

Expedition requests reports on ALL instances of beacon reception.

> The point of my original posting was nothing to do with nets,
> obscure or not. I merely pointed out that 14195, 21295 and
> 28495 are internationally-recognized spots for DXers to gather.

Looking at the IARU (International Amateur Radio Union) Region 1
HF band plan the only frequencies specially allocated for
intercontinal DX are 3.5-3.51 MHz (CW) and 3.775 - 3.8 MHz (phone).

In the band plan it is stated that there can be recomended meeting
points for special interest groups (QRP,AMTOR etc.),
but this doesn't mean exclusive use of a certain frequency.

The situation in Region 2 should be similar.

The full text of the corrseponding IARU Region 2 band plan should be
checked to se what applies to North and South America.

This is also your archive, so any additional articles, guides, or small
PostScript graphics that you feel would enhance this collection are most
welcome. Submit to Devon via his E-mail address above.

Thanks go to Devon Bowen, KA2NRC, for providing diskspace and maintaining
these valuable archives, as well as all the authors who wrote and submitted
the information contained in them.

Additional archives out there that have /pub/ham-radio directories are
encouraged to "mirror" these files to provide redundant storage for these
documents. Some of these sites (which may or may not mirror
ftp.cs.buffalo.edu) include:

Questions about FTP mirroring and access to appropriate software should be directed to me, or do an Archie search on the keyword "mirror."

For those without FTP access (and only those without FTP access, please), there is an FTP mail server at ftpmail@decwrl.dec.com. Send the word "HELP" to this address for more information.

Additional documents on Usenet and other newsgroups may be obtained from rtfm.mit.edu via anonymous FTP or via mail server (send the word "HELP" to mail-server@rtfm.mit.edu).

The American Radio Relay League has recently made available a mail-server to distribute many of their informational documents in electronic form. Send E-mail to info@arrl.org with "HELP" in the message body for more information. These files are also mirrored on oak.oakland.edu.

Yet another mail-server has been made available by Steve Harding,
KA6ETB. Send E-mail to ham-server@grafex.sbay.org with "HELP" in
the message body for more information.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

The following is a QST

The FCC decides not to retest hams in the alleged California VE scandal, a court transcript may preclude an appeal by two hams barred from a repeater and lots more about Dayton '94 on Newsline report number 874 coming your way right now!

CAL RETESTS RESCINDED

The FCC has done an about face on forty-two of fifty-nine Southern California hams it ordered to be retested three weeks ago. Late word is that the commission has told the ARRL VEC that it has decided to process the license applications from three examination sessions that have been under scrutiny for the past several months.
No explanation was given for the change of heart by the FCC, but it is believed that a number of those told to retest had instead threatened the government with violation of civil rights litigation. It is also believed that United States Senator Barbara Boxer had been approached by at least two applicants who asked that she intercede with the FCC on their behalf. A call to Boxer's office for confirmation or denial not yet been returned by the Senators staff.
While a number of hams trying to upgrade may be off the hook, the same is not true for the three dozen or so California Volunteer Examiners ordered suspended last year by the FCC. The commission still does not want them testing. None of them have been reinstated by their respective VEC's and the government indicates that the probe of their activities is still ongoing.

(*****
CLARA

The restraining orders issued several weeks ago against two Southern California hams may not be appealable on grounds of federal preemption. This is because several key words that the dealing with federal preemption over state and local law do not appear in the official hearing transcript. Attorney Sidney Radus, N6OMS represented the Claremont Amateur Radio Club who were the plaintiffs in the recent court actions.

"I do have a copy of the transcript of the judges ruling in the action of Krist, Lowinger, Radus, Adhall vs Tony Cardenas Drew B. Feldman. And nowhere in his discussion does he ever mention Part 97.113 as a basis for jurisdiction in the state court. The jurisdiction in the state court comes from a number sources. It does not rely on 97.113." Sidney Radus, N6OMS.

As far as we can figure out, the request by Cardenas and Feldman to change the venue of the hearing into the federal court based on federal preemption was a pre-trial motion. As such it may not have recorded in the actual transcript of the case. Meanwhile, Cardenas has been heard on a local Los Angeles repeater discussing a possible appeal based on an early 1970's case involving a ham accused of bothering a regional net. In that matter, the ham was reportedly successful in getting the action against him dismissed by citing federal preemption. He then filed a suit against his accusers and was awarded an undisclosed sum. Unfortunately, that legal action took place several years before the Newsline organization was founded. Because of this we have little information on it. Nor do we know if any binding precedents were set in that case.

(*****
NAL's ISSUED IN FLORIDA

The FCC has issued Notices of Apparent Liability to Monetary Forfeiture to three Florida Citizen's Band operators. This for alleged violations of the Part 95 service rules that include the possible use illegal power amplifiers. The NAL's issued were for $1000, $1500, and $4000. All of the CBers involved have indicated their intention to appeal.

(*****
MISCELLANEOUS VIOLATIONS

The FCC has also released a list of eight individuals cited for assorted violations including operating radio stations without proper authorization and operating on unauthorized frequencies. The fines here range from $250 to $6400. No other details were given in the FCC release.

(*****
WASHINGTON GETS LAW ON TOWERS AND ANTENNAS

Washington State has new legislation to protect amateurs. Washington's governor has signed Senate Bill 5697 into law. The new statute limits the ability of municipalities to enact antenna and tower regulations by pointing out the federal pre-emptions of the FCC's PRB One. ARRL Washington State Government Liaison Frank Price, KD7AC says he credits Dr. Ralph Shumaker, WX7T, and members of the Mike and Key Club of Seattle with promoting this legislation.

(*****
DAYTON HAMVENTION FOLLOW-UP

The official numbers are in. Even with the torrential rains that hit Ohio the last weekend in April, attendance at the 1994 Dayton Hamvention still broke the 33000 mark. The numbers prove that not even mother nature can keep true hams away from this world famous event.
Nether rain nor wind nor cold deters amateurs from going to Dayton. Monitoring Times Magazine Publisher Bob Grove, WA4PYQ rates this years Hamvention excitement level almost off the scale.

"From a stand point of enthusiasm it's incredible." Bob Grove, WA4PYQ.

Heavy rains drive thousands of flea market fans inside Hara Arena Saturday, typically Hamventions heaviest day. With no shortage of people there's plenty of socializing. Every where you turn you hear plenty of sales pitches for the latest and greatest. Hams spend money at Dayton despite the dollars weak standing against the yen.

"I think all the Japanese manufacturers are making a lot less right now, but the bottom line is they want to sell the product, so I think the manufacturers are going to make a little less profit in the short term." Yaesu USA's Kevin Karamanos, WD6DIH.

At several forums it's standing room only. Among the most popular, the SAREX 10th Anniversary celebration moderated by Newslines own Roy Neal, K6DUE. And a special announcement at the Youth Forum. Young hams are about to get a special treat. The chance to make a extremely rare DX contact.
Los Angeles resident Jim Neiger, N6TJ travels to Ascension Island May 20th. Jim has been an avid DXer since he was 15 years old. He plans to be on the air in the Novice bands to give young hams the chance to score both voice and cw contacts.

"I will be arriving there, I said on the 20th. I should be on the air the night of May 20. I'm going to concentrate on working young amateurs on Sunday, May 22nd conditions warrant it. I hope to be on 10 meters 28.400 Mhz SSB from 1700 to 1800 zulu on May 22nd. Then at 1800 zulu I will QSY to 15 meter cw 21.125 Mhz." Jim Neiger, N6TJ.

Jim wants to young hams to share in the thrill of rare DX.

"I've been a ham since I was 15, 40 years in the hobby. I've been chasing DX since I was 15. It's time to try and give something back a little bit. I've been very negligent in spending time on the Novice bands and things, so I'm going to try and take an opportunity to spend more time doing that." Jim Neiger, N6TJ

This years attendance 33,616. That's about 600 down from the year before. Transportation to Hara Arena, a major concern this

year draws good reviews.

"I believe the transportation from the designated parking areas has worked out extremely well. In reality I think it has worked better because we have a better flow of the buses. It's is not the long arduous trip, if you will, that we used to have from hotel to hotel. Now it's quicker." Jack Mitchell, AA8Q is a former Hamvention General Chairman.

Back outside it's not just water falling from above. A single engine airplane, it's callsign hidden from view buzzes the arena less than 200 feet up. Suddenly the flea market is showered with flyers carrying dollar bills. A ham from Ashland, Kentucky grabs 9 dollars worth.

"I had about nine of them and I gave two, three or four of them away I guess. Everybody just started grabbing them I said here and I just started picking them."

Weather and crowds aside, Hamvention '94 was a weekend of information, activity, and fun.

"Hamvention '94 of coarse is a phenomenon that's hard to describe. Seeing tens of thousand of amateurs all in one place at one time. It's something that's just not duplicated anything in the world. It's a pilgrimage we all must take. We take it, were not really sure why we are here, but we just know we will come back next year." Monitoring Times Publisher Bob Grove.

There is general agreement Hamvention '94 was a good one. But if you want to play it safe next year, be ready for any kind of weather. In Dayton anything is possible!

If you're a young ham and would like to have a shot at scoring that rare DX contact with Ascension Island, here again is information on frequencies and times. First, from the United States, turn your beam slightly south of east. Be listening for N6TJ Sunday, May 22nd. He'll be right in the middle of the Novice band at 28.400 KHz on sideband. He plans to be on the air between 1700 and 1800 hours Zulu. At 1800 Zulu, he'll switch frequencies to 21.125 KHz to work CW. If your code speed isn't all that fast, don't worry, Jim says he'll match your speed, get your call, and get your rare DX contact logged.

(*****
W6KG MEMORIAL FUND ESTABLISHED

The ARRL says that it is the beneficiary of a life insurance policy left by famed DXer Lloyd Colvin, W6KG and it wants to use the proceeds to continue his work. As a result, the proceeds, more than 150,000, dollars, will now fund an endowment, the income from which will be used to further the strengthening of international friendship through DXing.

Lloyd Colvin W6KG died last December while on another of his Yasmee (pronounced Yaz mee) DX operations. ARRL Executive Vice President David Sumner, K1ZZ says that during his lifetime Lloyd and his wife Iris, W6QL made many great personal contributions to international friendship through Amateur Radio.
Announcement of the Colvin Fund was made at the International DX Convention in Visalia, California, on April 16th. Details of the administration of the endowment have not yet been worked out.

(*****
USE THE RIGHT FORM

The ARRL is also asking anyone submitting cards to please check the DXCC application form you plan to use to insure it is the correct one. The current form is identified as MSD-505/194. It must be used for all new and endorsement applications since older forms lack spaces for critical information needed for processing your DXCC request.

UNITED KINGDOM NEWSLINE

The United Kingdom now has a Newsline like service of its own. Citing a need to service its news hungry hams, the Radio Society of Great Britain has added a telephone hotline to augment its on-the-air Amateur Radio news bulletins.
The RSGB over-the-air service is similar to ARRL's W1AW in that it is available on voice and packet. It differs from W1AW in that its read only once a week on a regional basis while ARRL issues bulletins daily.
Newsline has sent a letter to the Radio Society of Great Britain offering them audio cassette copies of Newsline to add to their new GB2RS dial in telephone service. If the Society accepts our offer, Newsline will become the first United States based ham radio news bulletin service with a telephone outlet serving the UK and Europe.

(*****

And for this week, that's all from the Amateur Radio Newsline.
You can write to us at Post Office Box 463 in Pasadena, CA 91102.

2128. Any recumbent bike/hams??

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-15 15:46:06 UTC
From: pea@wri.com
Message-ID: <Cpup4v.Bx0@wri.com>
Source record: 266790

Are there any recumbent bike riders/hams out there??

Any Infinity/ham riders?? I'm getting a new Infinity
and want to put an antenna for my ht on it. Any
suggestions??

Thanks!

73 de Bruce, N9WKE

Then you need to put up a better antenna. The maritime net on 14300 kc
has been around for at least 20 years handling traffic, WX and phone
patches for sailors in the Pacific. Back in '82 I sailed a boat from
Hawaii to San Francisco and checked into that net daily - they provided
phone patches to the Weather Service and to my parents daily.

At any one time there are dozens of sailboats plying the Pacific and
14300 provides a lifeline for them. Distress and medical calls are
handled periodically on there. The Coast Guard will, when necessary,
put their 10kW xmtr on 14300 to directly handle a distress call.

2132. Cheap Discone Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-15 18:46:37 UTC
From: asplund@girtab.usc.edu
Message-ID: <2r5qmd$mgo@girtab.usc.edu>
Source record: 266813
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc,rec.radio.scanner,rec.radio.shortwave

Hello all,

Recently I saw an ad in one of the hundreds of scanner/ham radio magazines I subscribe to for an inexpensive (around $29.95) discone antenna. However, I cannot seem to find the ad after many hours of looking. Since I am looking to purchase five of these antennas, I would like to find the best deal possible.

If anyone knows of a good source for inexpensive discone antennas, I would appreciate it if you passed the information along to me at: asplund@aludra.usc.edu.

Thank you for the help.

Source record: 266794

In article <linleyCpKosM.6qE@netcom.com> linley@netcom.com (Bruce James Robert Linley) writes:
>Which brand of AA NiCads has the highest Ampere-hour rating? The highest I've
>been able to find so far is Radio Shack's 0.85 AH cells. Are there 1 AH cells
>out there or is 0.85 as good as it gets? Oh, and of course, cost is a factor
>too. Many thanks in advance. 73.
>
>--

The RS batteries can NOT be quick charged under any circumstances. I would also consider the Millenium batteries. They are ordinary NiCa batteries, but made to very high tolerance specs. They can be quick charged in Millenium's charger in about 2.5 hours. The charger then keeps them trickle charged for as long as you leave them in there. While they have the same AH rating as most nicads, I find they last 30% to 40% longer then ordinary nicads in LOW drain applications (like powering a scanner). They don't seem to do better then others in high drain apps (transmitting for example), but then they can be re-charged much faster. They are a bit more expensive, but I would at least consider them. I've been using them for a couple of years in my scanner, and they are great...

Also, look for the new Lithium Hydride batteries. They are NOT rechargable, but they last 3 times as long as alkalines in high drain applications. They are also 3x more expensive, but they have the added bonus of a 10 year shelf life! Very good for emergency situations.

SB DX @ ALLBBS $OPDX.158
Ohio/Penn DX Bulletin No. 158

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 158
BID: $OPDX.158
May 16, 1994
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DL7VEE & DXNL, DF4RD, ON4ALY, K4CEF & Southeastern Cluster Group, AD1C, KA1NCN, K4XU, KH6GMP, K8AAI and K8YSE for the following DX information.

160 METERS. There will be a special operation from North Oahu, Hawaii, using above average antenna systems on both RX and TX. Activity will be from 0200z on May 21st to 1600z on May 22nd (local sunset to sunrise). Look for KH6U and KH6IRT on 1830 kHz (CW and SSB). KH6IRT is going to try to work all states to get the WAS award. KH6U needs only the following states (to get his WAS): WV, AK, VT and RI.

C2, NAURU. Ron, ZL1AMO, is now active as C21/ZL1AMO, but his length of stay is unknown. Ron moves from island to island faster than we can report his activites. So he may be already at his next stop which is to be Western Kiribati, T30, after this C2 operation. Meanwhile, Ron has been heard 3508/1035z, 7005/1100z, 7210/0700z, 10104/1130z, 14027/0400z, 14088/0445z (RTTY) and 18075/0200z. QSL via ZL1AMO.

FP, ST. PIERRE & MIQUELON. Dave, KA1NCN, will be active from July 19th through July 25th (including participation in the IOTA contest) as FP/KA1NCN. He will operate on 160-10 meters (including the WARC bands) using CW, SSB and RTTY. Dave mentions he will be listening and paying special attention for European and Japanese station. He will also operate (when practical) in the General or Novice portions of the bands. There is a possibility Dave may operate from Bermuda (VP9) as KA1NCN/VP9 after his FP operation. QSL via AA1AS (ex KD1FE), Justin Munger, 26 Caratina Avenue, Pittsfield MA 01201 USA.

OK, CZECH REPUBLIC. Bob, K8AAI (NODXA member), will be spending two weeks here beginning May 31st. He is unsure how much time he will be able to operate, but he has received the call sign OK8ECX. Bob will be operating from Jan's (OK2JS) QTH in Velke Bites. Depending on band conditions, be looking for him on 21444 or 14263 kHz at 1500z (especially

on the weekends). He will operate CW on request. QSL to Bob's CBA.

SPECIAL EVENT STATION. Members of the club Ninove in Belgium have been issued the special callsign of F/ON6UN/P ("France ON the 6th of JUNe) to commemorate the landing of the Allied Troups during the Second World War, on the 6th of June 1944. This 24 hour operation will start 0200z on the June 6th. Activites will be on CW/SSB, 80, 40 and 20 meters. There will be activity on VHF SSB and some local VHF/UHF packet radio. A special QSL card will be issued. QSL to ON6SI - via the bureau or direct to: Zarlardingestraat 73, B-9500 Geraardsbergen, Belgium.

TK, CORSICA. On May 15th, Dieter, DF4RD, should be on the island and will be helping to install (as every year) a youth-camp on the west coast of the island (approx. 30 km north of Ajjacio). He will be taking a radio, but his activities will be limited.
Just a reminder! Seven Italian operators will also be active from here May 19-23. Activities are planned for an all band operation (160-10 meters, including the WARC bands) on CW and SSB. They will operate on the usual DX frequencies with an emphasis on the WARC and the lower bands.

TT, CHAD. A French operator signing F5OIJ/TT8 was heard on 21335 kHz around 1345z, May 13th. The operator stated he would be there for the next 3 to 4 months and will be issued the callsign TT8PS sometime this week. No QSL information was reported, but the operator will be active on CW/SSB and on all bands, including the WARC bands.

"WAR", ARMED FORCES DAY STATION. Once again, NODXA members Bob K8BL, Dwaine WA8MEM and John K8YSE will operate US Army Radio Station "WAR" at Ft. Detrick, MD, in the annual crossband test with amateurs on Armed Forces Day 1994. Operation will commence at 1300Z May 21st, and continue until 0200Z May 22nd, and possibly later if amateurs are still calling. Frequencies are: 4020 7363 LSB; 14402 20994 USB; 6998.5 13992.5 CW. Listening frequencies in the amateur band will be announced. QSL cards will be sent to the CBA of the station worked. They will be listening for USA and DX. Last year 10% of the contacts were with Europeans. There will be other Armed Forces Day stations active during the times mentioned. Check May QST, page 136 for more details. Frequencies shown in QST are "center of emmission." Certificates are available for those copying the Secretary of Defense broadcast in CW or RTTY modes. See QST for times.

X5, (WHAT IS IT? WHERE IS IT? -- de Dick, 9A/K4XU) X5 is an UNOFFICIAL (self-assigned) prefix being used by Serbian hams operating from within the borders of Bosnia. Since the government of Bosnia still claims the land and is still the recognized government which can issues only T9 licenses, these stations are unlicensed and are not valid for DXCC purposes. There are also Serb stations using the X5 calls operating from Kranja, another occupied part which is adjacent to Croatia, which further confuses matters. For the same reason, these stations are not licensed either, though the Croatian government will issue legal 9A calls to those who apply. I have no stake in the conflict, but these X5 operations continue to add to the pileups and plus the sending of green

stamps for QSLs for these guys will not help the issue. Nor will it add to your DXCC standing. (edited by Tedd, KB8NW)

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and the FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as KB8NW/OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

Sorry - I can't let that pass. There is a public service aspect to Ham
Radio, which is why the spectrum space is allocated for that use (dumb
hobby?)
(probably more so in the VHF/UHF bands - but you still do see occasional
uses
of long haul HF circuits for health and welfare messages in large scale
disasters (earthquakes, hurricanes, etc)).

I can't really see any parallel to the use of assault weapons.

Note to flamers: I havn't made up my mind on the gun ownership issue. I
can see both sides of the argument, although to me the NRA's rhetoric
is very shrill and not convincing.

I think what happened here is there may be laws other than what the FCC
rules say that that Ham got trouble from. The FCC may say "no problem",
but the state or county or city has a law saying "never do this no matter
what". Which adds up to you can't do it.

XE1TU Announces That Launch Date For UNAMSAT-1 Is Set

David Liberman (XE1TU) has spent the past five weeks in bed trying to get rid of a bad case of hepatitis. But he reports that he is well again and back in the lab preparing to begin the launch campaign of UNAMSAT-1 MICROSAT. The launch date has been set for the 15-JUNE-94, but there is a possiblity that it might get delayed about one week. XE1TU and his UNAMSAT-1 team is preparing to leave Mexico City soon to fly to Moscow where UNAMSAT-1 will be put into a thermal vacuum chamber and tested before it is attached to the launch vehicle.

XE1TU would like to thank all those who sent him "get-well" messages and cards and he promises to answer all of them. XE1TU notes that when he returned to work last week, he had over 530 messages waiting for him on e-mail!

Watch for progress reports about the launch campaign of UNAMASAT-1 in the AMSAT News Service (ANS) bulletins.

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS
21-May-94 2130 B 185 VE2LVC W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

"Slow Scanners" are invited to join the SSTV sessions on AO-13. The frequency is 145.955 MHz. The net meets at 45 minutes before Mode S, and on Mode B following Mode S on Saturdays and Sundays. Join those sessions or convey your wishes for other SSTV skeds to wb6llo@amsat.org, and he will coordinate your efforts.

I just received a catalog from the Tele Path Corporation - they deal
in used vhf/uhf commercial gear. Give them a call and explain your
needs; their prices are very reasonable.

Example: Motorola Mocom 70, 450-470 mc, $19 each (5 or more).

Other Moto goodies: Syntor, Spectra 900, Mostar, MTX handhelds,
Syntor X and X2, Traxar, STX handhelds, Spectra, MCR/MCX 100,
Micor, Mitrek, Flexar Base, Mitrek Base, Mocom 70 Base,
Micor Repeater, MX 300 handheld, HT90/450 HT, HT600/P200 HT,
MT1000 HT, Saber HT, P100/HT50 HT, MT1000MVA, Pulsar.

I won't list the GE, Johnson, Uniden, and RCA stuff.

Accessories include cavities, duplexers, isolators, combiners, tone
boards, amps, repeaters; also a 30,000 tone reed and TCXO bank.

Their telephone number is 800-292-1700 (Calif: 510-656-5600);
address: Tele-Path Corp.
49111 Milmont Drive
Fremont, CA 94538

They say, ``Thousands of used and reconditioned mobiles, bases, repeaters,
portables, pagers and mobile telephones... We take trade-in equipment...
Technical support.''

Disclaimer: I have no business interest in Tele-Path and have never
bought any item from them. I just have fun browsing through their
catalog.

>segment in some parts of the world. If the transmitter is in Region 1, beamed
>to a point not in Region 2, that makes THEM a legitmate user and YOU a jammer.

Oh my. Ed, open up a copy of WRTV or Passport and ask yourself why
the legitimate users of the 7100-7300 kc segment are beaming to
Region 2 countries; I didn't think that was legal.

Also, if I'm conducting a QSO on a clear freq in that segment and
suddenly get blasted to the moon due to an oncoming BC'er then
who's the jammer? Hmmm, shouldn't Radio Phnom Penh have checked
to see if the freq was clear prior to starting their beamed-to-Region 2
bcst?

I doubt if my pipsqueek QRPp xmtr is causing much QRM to Region 1.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 15/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 15 MAY AND FORECAST UP TO 18 MAY

IPS Warning 13 was issued on 09 May and is still current.

1A. SOLAR SUMMARY
Activity: Very low.

Flares: None.

Observed 10.7 cm flux/Equivalent Sunspot Number : 091/036

1B. SOLAR FORECAST
16 May 17 May 18 May
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 090/034

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: unsettled to active with minor storm
levels from 06-09UT and 12-15UT.

Estimated Indices : A K Observed A Index 14 May
Learmonth 26 3354 5343
Fredericksburg 23 19
Planetary 25 22

Observed Kp for 14 May: 2553 3333

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
16 May 20 Unsettled with active periods mostly during night
hours.
17 May 15 Unsettled.
18 May 10 Quiet to unsettled.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
15 May normal normal poor-fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
16 May normal normal poor-fair
17 May normal normal fair
18 May normal normal normal
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values with 20-50%
enhancements 08-15UT and 30% depressions 19-20UT.

Observed T index for 15 May: 45

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
16 May 30 Near predicted monthly values.
17 May 35 Near predicted monthly values.
18 May 35 Near predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
None.

On behalf of the author I have uploaded to the SimTel Software
Repository (available by anonymous ftp from the primary mirror site
OAK.Oakland.Edu and its mirrors):

SimTel/msdos/hamradio/
sdi537.zip Hams: 1994 IOTA contest logging software

Super-Duper for IOTA (SDI) by Paul O'Kane EI5DI is a comprehensive and
easy to use logging program for the RSGB IOTA Contest. SDI is derived
from Super-Duper Version 5.36, which caters for the major RSGB and
international HF contests.

Main features:

* Fast, simple logging and editing - in "Expert" and "Novice" modes.

* No multiple keystrokes required for logging or editing.

* Instant duping, whether 3 or 3000 QSOs logged.

* Generates Check Lists, Multiplier Lists and Summary Sheets.

* Partial Callsign enquiry by prefix or suffix.

* Unique feature - checks complete log for consistency after each
QSO or Edit.

* Permits any combination of on-line or off-line logging.

* Log is 100% ASCII - edit with any text editor.

* Export log to SHACKLOG or TurboLog, integrate with station log.

* Updates log file after every QSO.

* Identifies Country by callsign, and Island by IOTA reference.

* Prints log by band, with page totals.

* Prepares your entry in the RSGB recommended format for entries
on diskette.

Landline BBS Open to All: 916-262-1657
RACESBUL.326 RELEASE DATE: May 16, 1994

Subject: TEC - Protecting Digital Terminals

Ever wonder why the computer fails when it shouldn't, or
sensitive equipment bites the dust?
A National Power Laboratory (NPL) power quality study
provides a clue. It showed an actual incident rate for
disturbances large enough to corrupt data or destroy equipment.
The study accumulated 450 site-months of power line disturbance
data from 74 monitored locations in the US and Canada.
During the study NPL recorded the following disturbances
that exceed computer susceptibility levels at a typical wall
outlet: 264 sags, 128 surges, 36 spikes and 15 outages. For
computers and other sensitive loads these figures indicate the
importance of power conditioning, lightening protection and
alternative backup power.

The above was by Charles Ruelle, NPL Director, in the Best
Power Technology Inc. newsletter "Horizons" January 1992 issue.
It points to why knowledgeable computer users opt for standby or
backup power systems. The result is that consistent random
computer problems are eliminated with an uninterruptable power
system, UPS or SPS, standby power system. We've proven this time
and again at State OES headquarters, where we've been able to peg
specific computer failures to observed commercial power grid
surges, lightning strikes and interruptions.

rice@ttd.teradyne.com (John Rice) writes:

| Tell that to the Ham in California who had his equipment confiscated (with the
| tacit approval of the FCC) when he used a 2M HT on a Public Safety frequency
| to call in Emergency Medical assistance, after other methods of communications
| failed (ham, Cell Phone).

The fact that his (Amateur) hand-held had been deliberately modified to transmit out of band had nothing to do with it? I understand that's what pissed off the Sheriff's department so much - not that he used that band, but that the rig was modified to use it...

In Australia that would cop you a $10,000 fine and/or gaol.

Let's distinguish between transmitting out of band (OK) and having the ability to transmit out of band (annoys the authorities). Those who argue that a life was saved as a result should probably support issuing 2m hand-helds to all citizens - they might be able to use them one day, but in the meantime we'll trust them to not misuse this privilege.

Seattle, WA May 13, 1994
To all radio amateurs

SB PROP ARL ARLP019
ARLP019 Propagation de KT7H

Solar activity has been very low, with geomagnetic conditions from unsettled to active. Solar flux bottomed out at 73, and is now climbing toward a probable peak around 105 centered on May 25 or 26. Look for conditions to remain unsettled, with recurring coronal holes returning to produce stormy conditions again after May 28.

For the CQ-M Contest this weekend look for moderately unsettled conditions, with flux around 85.

Sunspot Numbers from May 5 through 11 were 15, 45, 34, 44, 16, 2 and 38, with a mean of 31.2. 10.7 cm flux was 73, 74, 73.8, 74.4, 77.3, 80 and 81.9, with a mean of 76.3.

The path projection for this week is from Benton, Kentucky, near Paducha, to Ukraine.

80 meters should be open briefly around 0130z. Check 40 meters from 0030 to 0330, and 30 meters from 2300 to 0430. 20 meters should be best from 2000 to 2300. 17 meters does not look promising, but on some days a check around 2000 to 2130 may prove fruitful. 10, 12 and 15 meters do not look good at this time.

HT>Your advice SUCKS. What in the world is the autopatch for? WRONG.
HT>Whatever YOU answered, its WRONG. Thats because whatever I DECIDE to

HT>FEEL is 'inappropriate'????????

HT> We dont need bully channel-cops like you around. Go beat your kids
HT>into submission again and get the hell off this newsgroup. We already
HT>have part 97 and its QUITE CLEAR on what it allows and doesnt allow,

HT>calls are free, IT DOESNT. So, USE THE PATCH WHENEVER YOU FEEL LIKE IT,
HT>HAMS.. Just stay within the LAW, not the holier-than-thou ideals of
HT>no-brain OLD FARTS like THIS GUY!!!!

When you own a repeater, have to keep it up, and listen to 45 minutes
of phone calls from a person who is looking to kill time on the patch
during his ride home...or kids arguing with parents...or idiots calling
in 911 to check their DTMF pad, or gobs of people who say "Hi honey, got
the house in sight", you can spout off. Otherwise, take a hike. Repeater
licensees have their call on the line every time the patch is brought
up. In fact, any third party traffic is sticky business. Put your call
on a repeater and then loose it because you let someone step just a
little too far...it's not worth it. Phone patches in general are
dropping off repeaters or being closed due to ops' abuse. Think a bit
about the repeater licensee's position in the matter first...you or no
one else have the right to jepardize thier call sign. It's OK if you
think its the "Holier-than-thou old farts syndrome", but you'll have to
live with it...

>what". Which adds up to you can't do it.

Except that the Communications Act overrides such local laws. The FCC (and
IRAC, in the case of Federal agencies) gets to say who can and can't transmit
on which frequencies; no one below the Federal level has such authority.

Bob, it's the cost of the license only. There's no real "vanity call"
applications in Canada, but after you pass your exam, you can pick your
callsign from a printed pool (at least in DOC offices, I don't know
about volunteer examiner exams). The pool contains new callsigns and
recyled ones (callsigns are reissued in Canada).

The story behind the "VA" prefix: In order to be eligible for a
two-letter suffix in Canada, you have to be an amateur for at least
ten years, at which time you send a letter to DOC requesting a call
sign change to two-letter suffix. In Ontario (3-land) there was a
huge waiting list compiled. (I was on the list 4 years and still had
a ways to go). Apparently DOC thought it would be nice to give those
on the waiting list a two-letter suffix (I thought it was nice too),
and on top of that, attempt to match the suffix to the amateurs initials.
I got a letter from DOC in October last year stating that VA3FD was
available to me, if I wanted it. Naturally I said yes. I also sent
a letter to the regional office stating what a good idea it was and
thanking them for making the opportunity available.

The DOC have since made the VA prefix available to Quebec amateurs,
and have opened it up to *all* amateurs, hence we now have VA3XYZ
(three-letter suffixes) so that everyone, apparently, can have their
initials (or what-have-you), as a "vanity call".

I wonder if I am alone in lamenting Industry Canadas choice of offering
Victor Alpha? I find that on the air, there is constant confusion between
VA and VE when it is said quickly. Invariably, the receiving station must
ask for the phonetic spelling because they sound so much alike.

I think it is a nice option to be able to have your initials and that would
clearly make it worth going to a VA call. But the logic of switching from a
VE3*** call to a VA3** non-initial call seems quite transparent to me because
it is obvious that it is post-VE3ZZZ.

Now, if only I can get all those special station prefixes sorted out...:)

Views expressed in this news bulletin are not necessarily those of the Broadcast Officer, the Relay Officers, or of the Society.

G-TOR - An Improvement?

G-TOR is a new digital mode, which has been developed by Kantronics. Most of its features (like on-line Huffman data compression, link-quality based baud rate adjustment, CRC, fundamentals of the packet structure, etc.) are adopted from PACTOR. The baud rate used in G-TOR can be 100, 200 or 300 baud. The main differences are the use of Golay forward error correction coding with the obligatory data interleaving and a hybrid ARQ system.

The Golay encoding however, as used in the G-TOR mode, is only able to correct 3 bits in a block of 24 bits and only half of this block (12 bits) carries information. The remaining 12 bits have to contain the required redundancy, and no new data. It is therefore only possible to correct a few errors despite the large overhead. For this reason the Golay encoding would only be useful for errors caused by short spikes on the higher short wave frequencies (10 to 20m).

You cannot however expect it to provide any improvements in typical 80m conditions. Here it is necessary not only to use hybrid-2 ARQ systems, but also suitable, powerful (invertible) codes, which allow the reconstruction of the original information, even when only the redundany block is received, rather than Golay or similar simple blockcoding, which always requires both blocks to be received to get the data trans-ferred.

The most robust HF (short wave), narrow band, data transmission systems known, apply very powerful convolutional codes with Viterbi decoding and soft decision (requiring an ADC/DSP just like analog Memory-ARQ). The processing speed of those systems exceeds the capability of a KAM by factor 100. Despite this very expensive approach, they only achieve around 10 dB better weak signal performance than PACTOR-1. The closer a system approaches the Shannon boundary (theoretical throughput limit) the more difficult it gets to gain another one or two decibels.

W0XI et al claim that they were able to transfer a certain file on the 20m band in about 5 minutes using G-TOR, whereas PACTOR, which was used afterwards, took about 20 minutes. The conclusion was that G-TOR would be about 4 times faster than PACTOR in general, which is actually impossible!! According to the system description, G-TOR can on average only be about 1.5 times faster than PACTOR.

The 20m band, which was used for the tests, normally provides a good SNR and only very few fluctuations. It is therefore obviously no problem to reach higher throughputs, especially when using 300 baud (even short wave Packet Radio could have been faster than PACTOR in this case). Also, the comparison between PACTOR and G-TOR was based on the PACTOR implementation in the KAM, which does not, apparently, provide the full performance anyway, due to the different converter and the missing ADC. Since the KAM already uses a modem designed for 300 baud operation, it is obvious that G-TOR is favoured.

The original PACTOR system will still do better than G-TOR on weak signals, as an ADC is used in the PACTOR-Controller (PTC) to allow real analog Memory-ARQ. To achieve impartial results, you have to transfer the same files containing random characters on the typical 80m conditions in G-TOR using two KAMs and in PACTOR using two PTCs.

The 8.64 characters per second, considered to be the typical average throughput of PACTOR, and which led to the conclusion that G-TOR would be 4 times faster than PACTOR, are much slower than the average rate we obtained with our units. Under even worse conditions we obtained around 17 characters per second, depending on the transferred information due to the Huffman coding.

Regardless of the Huffman data compression, which improves the throughput of both systems in the same way, the comparison of throughput between PACTOR and G-TOR can be easily calculated. According to the protocol description published by W0XI, G-TOR is able to transfer a maximum of 19 characters per second when running on 200 baud (They claim 69 data bytes in a cycle duration of 2.4 seconds at 300 baud, which means maximum 2/3*69/2.4 characters per second at 200 baud). The maximum

rate of PACTOR at the same speed is 16 chrs/s, which is a relationship of 1.18 to 1. The Golay encoding is not able to improve the throughput so dramatically that you finally result in a factor 4. It must be remembered that the analog Memory-ARQ, as used in the original PACTOR implementation, is able to improve the effective signal-noise ratio with each aggregated packet and hence enables a higher throughput (especially in weak conditions) than the Golay coding gain. It is therefore obvious that the higher maximum throughput of G-TOR is mainly based on its higher maximum baudrate. This however means, it has to exceed the usual 500 Hz band width limit.

With this in mind it must also be remembered that a wider receiver bandwidth receives more noise. A 300 baud G-TOR signal will therefore have a poorer S/N ratio than a 200 baud PACTOR signal (if they are both of the same fieldstrength and the receiver bandwidth is correctly adjusted for both modes). As signals decrease, G-TOR would have to switch to 200 baud before the PACTOR signal would be affected, thus further reducing some of the proposed speed gain.

There are still some more disadvantages of G-TOR in comparison to PACTOR, e.g. the cycle duration is quite long at 2.4 seconds, and will increase to almost 5 seconds when using the Golay encoding, hence leading to quite long break-in times. The speed adaptation times are necessarily also longer, thus leading to poorer results in rapidly changing conditions (multipath).

Furthermore, the interleaving and the 3 different baud rates used in G-TOR will probably lead to a lot of problems with the listen mode, an important point for all digital modes used in Amateur Radio.

Actually G-TOR is just a modified PACTOR system, which probably does not provide enough improvement that introducing this mode as another new standard would be worthwhile. With regard to the basic requirements of each digital data transfer mode (like throughput, bandwidth, error rate, etc.) PACTOR already represents nearly the optimum attributes that are obtainable with an FSK system. A real improvement over the current PACTOR system can only be reached when using different modulation schemes like PSK, which require a DSP hardware.This step will be done this year with the introduction of PACTOR Level-II.

Tom Rink, DL2FAK

VOLTA RTTY WW Contest (conclusion)

Contest period: from 1200z Saturday to 1200Z Sunday 14-15 May (24 hours, no rest periods required)

Final score = total QSO points x total mults (band mults plus each INTERNATIONAL COUNTRY worked on 4 bands) x total number of QSOs. Use exchange points table to determine points scored for each QSO.

Awards: A SPECIAL trophy will be awarded to the top stations in each class. In addition, a certificate with special sticker to all entrants.

Logs: Use separate logsheets for each band. Logs must show: BAND, DATE and TIME (UTC), CALLSIGN and MESSAGE Sent and Received, POINTS and NEW MULTIPLIER PREFIX. Summary sheet must show full scoring, and list of multipliers worked.

Logsheets, summary sheets amd multipliers and dupesheets and the EXCHANGE POINTS TABLE are all available for copying from the RTTY Contesters Guide, published by RTTY Journal.

Logs must be received by July 30, 1993, to qualify.

Mail logs to:

I.P.S. SUMMARY OF ACTIVITY

Solar activity was very low during the period.

The geomagnetic field at Learmonth (WA) was mostly unsettled to active. There were minor storm periods on 7th-8th, and 11th May

Ionospheric F2 critical frequencies at Sydney were about 10 per cent below predicted levels on 6th, and mostly near predicted values for the rest of the week. There were depressed periods to 30 per cent on 8th, and to 40 per cent on 11th. Spread F was reported on 6th-9th, and 11th-12th, with Sporadic E observed on 11th May.

FORECAST FOR THE NEXT WEEK (13 - 19 May)

SOLAR: Very low to low

GEOMAGNETIC: Mostly quiet to unsettled today. Unsettled to
active with minor storm levels 14th-15th.

IONOSPHERIC Near predicted monthly values to 30 per cent down
14th-15th. Otherwise near predicted monthly
values. Spread F may degarde night communications

2155. Need ICOM CI-V Interface Software for PC

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-16 08:15:03 UTC
From: M.Willis@ee.surrey.ac.uk
Message-ID: <1994May16.081503.3170@ee.surrey.ac.uk>
Source record: 266827

I have picked up an ICOM CI-V interface unit (it was cheap). I wonder if there is any PC software available that will handle a network of rigs, specifically an IC735 and an IC275.

I already have the CI-V manual. I want to make my notebook pc control the rigs. E.G Log onto a BBS, read the mail, check the DX cluster, read the frequency and mode, enter them into the log etc.

I have a program that will do a good job for a single rig, but not one that can handle multiple rigs.

2156. Mobile HF Hash - Ideas?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-16 10:16:03 UTC
From: yvesf@aol.com
Message-ID: <2r7h53$m82@search01.news.aol.com>
Source record: 266815

Installing a TS50 in 1 1990 Legacy Subaru s/wagon, I discovered the N/B is pretty good on pulse noise, but worthless on hash (used an IC-740 previously with an excellent variable N/B, got rid of 90% of all noise no problem, hardly any artifacts)

Anyone had any experience with eliminating alternator hash and microprocessor noise on Subaru Legacy? Any ideas would be very much appreciated!

Thanks, 73, Yves (Al) W1EOX

2157. Drake MN2000 manual wanted

Newsgroup: rec.radio.amateur.misc

Hey, I think everyone has the right to do their own thing,
if it doesn't hurt others! But if your running through
a South American rain forest without clothes, you just
might get bit in ass by a "trap door spider"!
At least wear a pith helemet and a good pair of jeans.

At a recent, 5/14/94, CEMARC (Council of Eastern Massachusetts Amateur Radio Clubs) meeting it was decided that we need to find out what "established" internet mailing lists are available to pass importnat messages to as many of the hams in our area as possible.

To further this goal... if you would not mind, would you please e-mail me any of the known lists that you are on or are aware of. At some point in time when we have a comprehensive list, I will repost the information to the net or JUST to those who are on the list. Your comments are welcome.

Recognized by what body?

> Major (and minor) DXpeditions regularly use those frequencies,
> and if you are going to call "CQ Ragchew" somewhere between
> 14190 and 14200 I am suggesting that you don't do it on 14195
> unless you are being perverse.

If the frequency is not in use, it is available.

> If a DXpedition comes on and
> asks you to move, you have two choices - you can refuse to
> because you were there first, or you can be friendly and move.

Gee, perhaps the DXpedition could start out by calling a friendly 'break,' using the occasion to check out their set-up, and then ask for control of the frequency when the QSO is over. A 15-minute rag-chew probably isn't too much to pay for getting established on a frequency, now is it? In other words 'if the frequency is in use, perhaps you can join them rather than beating them!'

> If you start a ragchew on 14192 you are not likely to be asked
> to move, but if you start one on 14195 there is a bigger chance
> that you will be, so why not recognize that 14192 is a better
> place to start out?

Because if every casual operator (who have just as much rights to the bands) keeps a list of every frequency which is someone's or some group's 'favorite,' and avoids it, we now have bands with 100 'edges' instead of the current 9 or ten per band. Between nets, quasi-nets, and bulletin frequencies, it's already tough enough for the casual operator to enjoy his or her hobby. Oh yes, let's not forget the 'satellite' sub-bands which are now springing up, even on 15 meters! We need to reduce to a minimum the number of 'reserved' spots which the hobby recognizes, and operate on a 'first-come-first-served' basis unless there is compelling reason

to do otherwise. And we need to recognize that a clear channel for the convenience of DXing is NOT a compelling reason.

> I know about two net frequencies on 20m, I rarely use them, I
> don't care for nets. But I would never start up a QSO on one
> of their frequencies even if they are not operating right then.
> This is what I would call courtesy before the fact. I suppose
> my point is that once one has been told that 14195 is a DX
> gathering frequency worldwide, it is combative to start a QSO
> right there when there are other frequencies available.

Only if the frequency.police MAKE it combative. What if, rather than being asked to clear the frequency, the person who called CQ on 14195 was invited to wait for DX together, during a rag-chew? 'So, over to you Jeff, and we'll listen for any DX breakers on the turn-over. WA8DX, this is WA6DCL/2 over and QRZ DX.'

Seems simple, doesn't it? Wouldn't it then encourage DX stations to join in? Wouldn't it give them something as a point of reference? Couldn't the stations rag-chewing then turn over the frequency to the pile-up? Or other stations break with information on when Outer Mongolia comes on the air, and where?

For God's sake, if people just stop yelling 'mine! mine!' and actually take the time to *TALK* to each other, the solution comes up and smacks them in the face.

Ham radio should be like a party, not like a dentist's waiting room. The bands are a group hang-out, not private property.

Greg

Greetings all,

I have a question for those knowledgable folks on the net. I am looking to pick up an HT at the ham fest coming to Rochester this weekend. Specifically, I am looking for an 2m HT that can be modified to operate on VHF marine frequencies (yes, I know out of band operation is illegal, but I want it as a back up on the boat, if my main radio goes south, or the battery goes dead, or whatever, I want to be able to call somebody on CH16!).

So, does anybody have a list of HTs that are modifiable to operate on the Marine band?

Reply via email as the local ham fest is this weekend. (Nothing like waiting until the last minute, I guess!)

Thanks in advance.

Dave Wright, N2TYR, djw@cci.com

Source record: 266880

Greetings,

I really don't understand it but ham people everywhere have
different ideas about how to care for NiCad batteries. Can someone give
me come technical information about NiCads? How do you take care of them?
Do you leave them in the charger untill you need them? Is there such
thing as "the memory effect" with NiCads? These are just some of the
questions I would like to ask.... Looking forward to your reply,,

NOTE: The Effective Sunspot Number for 14 MAY 94 was 21.6.
The Full Kp Indices for 14 MAY 94 are: 2o 5- 5+ 3+ 3o 3- 3o 3o
The 3-Hr Ap Indices for 14 MAY 94 are: 9 38 59 19 14 14 15 16
Greater than 2 MeV Electron Fluence for 15 MAY is: 8.0E+07

SYNOPSIS OF ACTIVITY

Solar activity was very low.

Solar activity forecast: solar activity is expected to be
very low to low. Region 7722 (N07E25) has the only realistic
chance of producing an isolated C-class flare

The geomagnetic field has been at unsettled to active
levels for the past 24 hours. High latitude stations saw
a period of minor to severe storming. Activity is most likely
due to a well positioned coronal hole. Energetic electron flux

(GT 2 MeV) ranged from normal to high over the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be unsettled to active for the next 24 to 48 hours
then mostly unsettled. High laltitude stations will see periods
of minor to major storming over the next 24 hours.

Event probabilities 16 may-18 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 16 may-18 may

A. Middle Latitudes
Active 35/30/30
Minor Storm 25/15/15
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/25
Minor Storm 25/25/20
Major-Severe Storm 10/10/05

HF propagation conditions were below-normal over the high
and polar latitude regions. Middle and low latitude stations
saw near-normal propagation with slightly below-normal
night-sector propagation. Conditions should begin improving
over the next 24 or 48 hours as the current disturbance wanes.
A period of quieter geophysical activity and better propagation
is then expected for the next week or so.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep

Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

I appear to wrong, but I learned all these various
frequencies you've been talking about as CALLING
frequencies. That means to me that you *establish*
a QSO on those frequencies, but then QSY to a mutual
spot to continue. The point is to provide a starting
point for the "few" (or many depending upon point
of view) to congregate. But I learned that one then
moved away from that point for the actual QSO in an
idea similar to net control so that additional startup
conversations could then begin.

Is that not done as I learned it? I'm not a DXer yet,
so don't have actual experience with these frequencies.

2169. Mounting a Radio in a Quest/Villager

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-16 17:23:47 UTC
From: im@hydra.carleton.CA
Message-ID: <CpwoBn.6J3@cunews.carleton.ca>
Source record: 266886

Well, I've had the new Quest for a couple months now and am still
trying to figure out the "best" place to mount the old TM701
and remote handset. In the old vehicle I mounted the radio under
the drivers seat and had a nice spot on the console to mount
a standoff for the RM10 remote handset.

The Quest seems to be a different story. There are no spots under
the drivers seat to mount anything to, and there don't appear
to be any easy spots to mount a standoff for the handset.

I'm wondering if anyone else has mounted a mobile radio in a
Quest/Villager, and if so where did you mount it, and where did
you tie into power?

That's how it works for some activities on some bands. It's not how it works with 14195, 21295, ..., though. Those are simply frequencies that are traditionally used by most of the major DXpeditions, often for hours at a time. If you heard the Peter I operation (60,000+ QSOs worldwide) that's where you heard them on SSB. They are not reserved for anyone, they are just the first frequencies a DXer checks if he or she is looking for a major DXpedition.

I seem to have annoyed a number of people by the mere mention of the existence of these frequencies and their use by DXpeditions. They are *not* reserved by any international law, and you are perfectly free to use them to ragchew across town if you want to.

So if you want to work casual DX, you go anywhere you want to in the band and call "CQ DX" - you won't be answered by Peter I island, for that you will have to listen around 14195 (well, they have gone now...), and I'm not aware of any DX "calling" frequencies on 20m. But if someone tells me that there is one, my attitude would be "great, I learned something new today", rather than "nobody owns any frequency, I can do what I like anywhere I like whenever I feel like it", which has been the response by a small number of people who are simply being told the facts of life, which is that major DXpeditions can be found on 14195 and 21295 when they are active.

Of course, serious DXers find most of their DX on other frequencies anyway, mainly by tuning and listening around. Ragchewers think that DXers tear up the band, DXers who only transmit for perhaps 5% of the time think that ragchewers are wasting spectrum. I don't defend either of these attitudes, and in fact spend nearly all of my time in the cw sub-bands, where people are friendly and accommodating.

There are "DXpedition frequencies" there too (close to 14025 etc), just as there are "QRP frequencies" (14060?) and probably others. We all get along together just fine. Again, if I were going to call CQ on 20 cw, I probably wouldn't do it on 14025, but there is no legal reason not to do it.

Newsgroups: uiuc.org.synton
Subject: Somebody named Loomis invented radio?
Date: 1 May 1994 02:01:51 GMT
Organization: University of Illinois at Urbana

I read something recently that a man named Loomis might have
"invented" radio in the late 1800's before Marconi & Hertz et al.

This might be an ancestor of the person for whom the University of
Illinois physics department "Loomis Lab" is named.

Does anybody else know more about this?

Tired of those old fashioned headstones? Want something special for your final resting place? What to take your call sign with you? How about a Marble HAM Headstone with your call sign tastefully engraved; possibility exists to have that antenna you always wanted but never could erect etched permanently along with your call sign on the same headstone. Antennas to scale. A special chip is available to emit your call sign and a CQ on the date of your demise, or date you were first licensed. If you are within several years of occupying your final resting please consider a HAM Headstone. If you should upgrade prior to death there will be an extra charge for reconfiguration. Remember you can take it all with you. Replies by E Mail. Advance payment in full required. Special discount for Ham couples (K4ADL take note) who will be residing together permanently.

This *problem* is normal operation. The radio is asleep 3/4 of the time
so if a QSO starts up while the unit is asleep, you miss part of it. My
Alinco DJ560 does it too. It's normal. That's how the battery life is
extended. It's almost like the radio is off for those few moments the
radio is in battery save mode. Don't send the radio back for repair!
If a signal is present, it does not somehow *wake up* the radio. The
radio merely wakes up every so often to see if a signal is there. If it
is, it stays on; if not, it dozes off again.

2178. HTX-202 problem

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-16 19:50:34 UTC
From: proctor@news-reader.nist.gov
Message-ID: <940516145034@emerald.nist.gov>
Source record: 266891

Hello,

I have a problem with my RS HTX-202 which I think is related to the power save feature. I set the time-slice for the power saver to 1/4 sec and turned on "SAVE". Since then, quite often, the receiver will turn on right in the middle of an ongoing qso. This happens even while listening to a local repeater which is S9+30 and the squelch is set just above the background noise (even an S1 signal will open the squelch). This has also happened while I was operating simplex. It appears that the receiver does not always "wake up" when a signal is present.

I have recently turned off the save feature, and the problem seems to have gone away, but I need more time to say that the problem is gone for sure.

Has anyone else had this problem? If it continues to work with save disabled, I will send it back for repair.

Source record: 266894

This may not be the best newsgroup for this, but I'm sure I'll be told where to go if it's not. :-)

I am about to purchase a gasoline-powered AC generator for Field Day (and similar) uses. I went to the local Supply One (super hardware store) and they had Coleman, Yamaha and Makita generators. The price of 5KW units varied from $500 to $1500. Interestingly enough, there were no Hondas in sight, even though I've seen more of them in the field than just about any other kind.

My question is, for FD use, with no need for fancy stuff like autostart or load switching, what is the preferred brand of AC generator? Where does one go for the best deal on one?

Thanks for any and all help.

I need to gather some info on building an antenna for short
wave reception? Please excuse my ignorance, I am very new at
this. Someone told me that All I need to do is connect a very
long thin wire from an adjacent tree to the house and one from
the ground and connect them into the adapter that goes into the
external antenna plug. I have some questions:

1) How long should this wire be? Is it somehow related to the
frequencies that I am interested in? What if I am interested in
more than one?

2) should the wire be shilded or unshielded?

3) what should be the gauge of the wire? The thicker the better?

4) should the wire be the meshed type or a single thread?

A similar case arises in aviation. The FAA rules say (paraphrased) that the
pilot in command is the final authority as to the safe operation of the
aircraft, and that the pilot in command my deviate from any rule to the
extent necessary to meet an emergency. However, these statements don't
operate to prevent enforcement of the same or other rules after the pilot
has exercised this "authority" in case of an emergency. For example, it is
a separate violation of a rule against "careless or reckless" operation to
allow oneself to get into a situation where the emergency "authority" must
be exercised.

So, there's a kind of Catch-22 situation in that the law or rule may say
you can break other rules in some circumstances - but it doesn't say that
the rule against breaking rules can't or won't be enforced.

Better not tempt the enforcers - unless it really will save _your_ life.

Actually, Jeff, since you already know what the show topics are, you have
the option of not listening to something you don't want to hear. And if you
are being charged to listen you have a point, but I haven't paid a
broadcaster yet for delivering an RF signal to the vicinity of my antenna
and receiver, nor have I been asked to do so, with the notable and IMHO
worthwhile exception of PBS and NPR.

If these are what I think they are...I had the same question, but described
them as whoopers (whoop whoop whoop. etc.) In my case they came from the
local oscillators in scanners.

For example, 154.46 - 10.7 (IF freq) = 153.76 Does that frequency get used
in your area? This gets more complicated when dealing with all the various
IF frequencies in use in various scanners.

The views expressed here are my own, not my employer's.

A quick peek into the FCC frequency allocation charts says that 154.46375
is allocated primarily for electric utility one-way communications for
load control. When in doubt, check with the guys in charge!

It had better not be, based on the above. That frequency is allocated
nationwide for utilities, using 350W output stations. Anything else is
secondary, and not just on paper at those power levels!

No, I'm not talking about missing the first 3/4 second of a qso. Please
give me a little bit of credit! :-) I'm talking about the receiver suddenly
turning on into a qso that has obviously been going on for some time (just
by the content of the conversation).

Another example, I was working a public service net a while back. The net
control station was no more than 100 yards from me, and the other stations
were no more than several hundred yards away. After 10 minutes of dead
silence, I keyed the mic, gave a short report, and when I let go of the PTT,
net control said, "Where have you been? I've called you about 6 times and
so-and-so called you several times." I looked at the S-meter, and he was
S9+30. The same thing happened later in the net. Once, just to see, I hit
the PTT very quickly, and sure enough, the receiver turned on and someone
else was in the middle of a transmission. I turned off the power save feature

and have had no further such occurances.

People have written:
>>
>>The RS batteries can NOT be quick charged under any circumstances. I would
>>also consider the Millenium batteries. They are ordinary NiCa batteries, but
>>made to very high tolerance specs. They can be quick charged in Millenium's
>>charger in about 2.5 hours. The charger then keeps them trickle charged for
>>as long as you leave them in there. While they have the same AH rating as
>>most nicads, I find they last 30% to 40% longer then ordinary nicads in
>>LOW drain applications (like powering a scanner). They don't seem to do
>>better then others in high drain apps (transmitting for example), but then
>>they can be re-charged much faster. They are a bit more expensive, but I
>>would at least consider them. I've been using them for a couple of years
>>in my scanner, and they are great...

Hmm.....

I have yet to see a Ni-Cd battery that CANNOT be quick (1 hr)
charged. The issue is not charging, but overcharging. Batteries
differ greatly in their ability to withstand abuse due to
overcharge. I bet those RS cells can be quick charged in 1 hour,
but I wouldn't overcharge them one bit, since they would probably
vent or explode. Charge control is the key to battery management.

Let us review once again why Ni-Cd batteries behave this way. Ni-Cd
batteries take charging current very easily -- too easily for their
own good. Hence the need for constant current charging rather than
constant voltage, as they would take too much current and destroy
the charger or themselves due to the huge currents. There are other
reasons for constant current which I will get to in a second.

The positive material is nickelic (Ni+3 or Ni+4) hydroxide when charged,
and nickelous hydroxide when discharged (Ni+2). The negative plate
is cadmium metal when charged and cadmium hydroxide when discharged.

As long as there is uncharged material left on the plates (i.e. nickelous
hydroxide and/or cadmium hydroxide), the charging current goes to
work and produces the nickelic hydroxide or cadmium metal as desired.

When the cell reaches full capacity, the charging current has to do some work.
Since the plates are fully charged, the work goes to split water,
a component of the electrolyte. Now, splitting water involves
producing hydrogen and oxygen. This is bad, since this is explosive
and keeping it in a sealed cell (even with vents) is NOT good. So,
the battery manufactuers got smart....

The negative plate is bigger (electrochemically) than the positive electrode, and when manufactured, is slightly discharged. This means that the positive plate is reaches full charge first, and generates oxygen gas. This oxygen gas then migrates across the separator to the cadmium negative plate, and reduces it, forming cadmium hydroxide, which keeps the negative plate from reaching full charge. Under these conditions, the cell can remain on charge ad naseum. The bottleneck is the diffusion of the oxygen from the positive to the negative plate.

Under high currents, so much oxygen is produced at the positive plate that all of it cannot diffuse across to the negative plate. This is bad for several reasons. First, there is pressure build up. Second, since there is a limited amount of oxygen diffusing across, the amount of cadmium hydroxide being produced at the negative plate is limited. So, some of the current actually goes to convert the "excess" cadmium hydroxide to cadmium. When this happens, hydrogen is produced at the negative electrode. Pressure builds up and the cell vents. Once that happens, you are effectively losing water from the cell and the cell is permanently damaged. How badly depends on how much water you lose.

Battery manufacturers are doing all kinds of tricks to outsmart the average user to prevent him/her from killing their cells. Newer fast charge cells use activated carbon to act as an oxygen sponge to prevent high pressures from building up and to facilitate diffusion of oxygen to the negative electrode. The cost of this is that the carbon takes space, and that means less active material. So, for a given technology, rapid charge cells of this type will have a lower Ah capacity than other cells.

Gas management is the key to withstanding overcharge. The better the ability to absorb the oxygen and deliver it to the negative plate, the more overcharge current it can handle. Of course, the generation and recombination of oxygen through the overcharge current creates heat, which is bad. You will note that Ni-Cd cells remain cool, even with high charge currents, and then quickly get hot as full charge is attained. If your cells are hot, then you have overcharged them -- slap yourself in the wrist.

In a quest to increase the Ah capacity of the cells, manufacturers are using sponge or foam electrodes. You get 20% more capacity out of these cells than regular sintered plate, but the cost is higher internal resistance. They do not perform well under high drain (i.e. transmitting) conditions. I believe that the Millenium cells are of this type. This would explain the apparent higher capacity under low drain conditions. The new Panasonic 900 mAh and the soon to be announced 950 mAh AA cell from Sanyo are of this type.

For best high drain performance, stick with the sintered plate. The capacity champ in this category is the Sanyo KR-800 AA cell, 800 mAh.

Stay away from hi-temp cells, unless you really have hi-temp, as the electrolyte is NaOH and has a higher resistance, again leading to poor

high drain performance.

Memory effect:

Does it exist? YES.
Is it easy to reproduce? NO.

Whenever Ni-Cds don't perform up to snuff, the excuse is "memory effect."

Originally memory effect was seen in spacecraft batteries subjected to
a repeated discharge/charge cycle that was a fixed percentage of
total capacity. After many cycles, when called upon to provide the
full capacity, the battery failed to do so.

Memory can be attributed to changes in the negative or cadmium
plate. Recall that charging involves converting Cd(0H)2 to Cd metal.
Ordinarily, and under moderate charging currents, the cadmium that
is deposited is microcrystalline (i.e. very small crystals). Now,
metallurgical thermodynamics states that grain boundaries are high
energy regions, and given time, the tendency of metals is for
the grains to coalesce and form larger crystals. This is bad
for the battery since it makes the cadmium harder to dissolve to
produce the discharge current. Hence you get "reduced capacity" or
more precisely, a voltage depression due to increased resistance.

The trick to avoiding memory is avoiding forming large crystal
cadmium. Very slow charging is bad, as slow growth aids large
crystal growth (recall growing rock candy). High temperatures are
bad, since the nucleation and growth of crystals is exponentially
driven by temperature. The problem is that given time, you will
get growth of cadmium crystals, and thus, you need to reform the material.

This does NOT mean that you need to cycle your battery each time you
use it. This does more harm than good, and unless you do it on a per
cell basis, you risk reversing the cells and that really kills them.
Perhaps once in a while, use your pack until it is 90% discharged,
or do a cell voltage of 1.0V under light load. Here, about 95% of
the cells capacity is used, and for all intensive purposes, is
discharged. At this point, recharge it and that's it.

The more common "memory effect" isn't memory at all, but voltage
depression caused by overcharging. Positive plate electrochemistry
is very complicated, but overcharging changes the crystal structure
of the nickelic hydroxide from beta-Nickelic Hydroxide to gamma-Nickelic
hydroxide. The electrochemical potential of the gamma form is
about 40 to 50 mV less than the beta form. This means that you get
a lower discharge voltage. In a six cell (7.2v) pack, this means
a loss of 300 mV. Trick? Don't overcharge. Leaving cells on a
trickle charger encourages formation of gamma NiOH. Expect your
cells to discharge at a lower voltage.

Summary:

DON'T deliberately discharge your batteries to avoid memory
DO let your cells discharge to 1.0V/cell on occasion through normal use.
DON'T leave your cells on tricke charge for long times, unless you can
tolerate voltage depression.
DO protect your cells from high temperature both in charging and storage.
DON'T overcharge your cells. Use a good charging technique.
DO choose your cells wisely. Sponge/foam plates will not tolerate high
discharge currents as well as sintered plate.

Take care of your cells, and they will take care of you. I have
a set of cells from 1981 that are still working. Sintered plate,
450 mAh old technology -- rapid charged used a delta-V technique.

Contributing to the mythology of Ni-Cds,

Ken

p.s. NiMH cells can exhibit memory too, for much of the same
reasons as above....(substitute hydride for cadmium). You will
note less touting of memory-free operation of NiMH cells in the
the future as more experience is gained.

This person has been caught jamming *6* times in the past two years.
Each time he was spoken to. Each time he cries and pleads for forgiveness
with promises that he'll never do it again. Two or three weeks later the
fun and games start all over again.

N1JBC, Jed Barton, is the culprit. He's a spoiled little rich kid from
an affluent section of the state, and his parents have no idea what is
going on. Nor do they want to know, if you attempt to tell them, they
dismiss it as he has already told them that people on amateur
radio are "picking on him".

I've got clean transmitter fingerprints of his jamming and other voice
contacts. There is no doubt that he is the culprit. Other people have
DF'd him right to his front door. He never denies that he did it,
privately, when you catch him. If you announce it on the radio he'll
deny it left and right, and accuse YOU of jamming. Since he works at
a local radio station making carts, he has been known to even record
people's conversations on the air and then splice together a conversation
and rebroadcast it on the air.

Recently one of the local trustees was in Boston and decided to
visit the FCC's office. They politely said "thank you" and are going to
do nothing. So, the jamming continues to this day.

At a recent club meeting, we discussed the issue. Someone said "Contact
the Section Manager!" Yeah, right. Our section manager can't even get
the section news in on time, although he is quite good at calling up
people on the phone and intruding in their personal affairs. Someone
else said "Contact an OO". Yeah^2. I know an OO, and even though I
have *positive* proof, she indicates that she cannot write a pink
slip unless *SHE* catches the person jamming. Great, considering she

never DF's or anything else.

> Others will say to avoid any contact with him but I've found that
> direct contact is a big motivating factor in the cessation of these
> kinds of activities.

Overall, it appears nothing will get done. If you contact the FCC,
they say contact the League. The League is powerless and does squat.

So, amateur radio does down the toilet, just as CB radio did in the
1970's when the FCC decided to stop regulating it. I give amateur radio
another 5 to 10 years before tuning in the 27.x mhz and 144+mhz range
sounds identical.

2198. A GEnie test

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-16 22:53:24 UTC
From: SPORTS@genie.geis.com
Message-ID: <2dd7f964.535041534349@hal.spasci.com>
Source record: 266924

Just trying to see if this stuff is actually leaving GEnie. WA2VCI WB2BFB.

2199. those nasty rude hams

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-16 22:58:06 UTC
From: oo7@astro.as.utexas.edu
Message-ID: <2r8tpu$o7n@geraldo.cc.utexas.edu>
Source record: 266906

blood@austin.ibm.com ( ) says:

>>Ive decided to quit saving for a HF rig after following this discussion.

You should really listen to the bands rather than making judgments based on what you read here. I must admit that if I were trying to interest an innocent youngster in HF ham radio, I would be very careful when tuning around the phone bands to demonstrate what a great hobby it can be. A lot of what you hear is uninspiring at best. There are several things you can do, though. You can tune past stuff you object to or simply ignore it - not a very positive action, but I do it all the time on the phone bands. You can spend more time on other modes - cw, rtty, satellites, there are probably some obnoxious types there too, but I think the rudest people stay on SSB where they have the widest audience (which is what they need), and because it's harder and less fun to belch in CW or AMTOR.

A more positive approach is simply to set a good example. There are plenty of considerate ops out there, and there is nothing in the rules that says you have to listen to people you find objectionable. The tuning knob is sometimes the most valuable one on your radio!

So don't give up on the HF bands without actually listening to them first and seeing how bad things really are. They are perhaps not for the weak of stomach or the easily offended. I suppose it depends on what your reasons are for getting a ham license in the first place. HF is not for everyone, nor is CW, nor is VHF, nor is county hunting. With 600,000+ hams in the US alone, this is probably a Good Thing...

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 16/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 16 MAY AND FORECAST UP TO 19 MAY

No warning is current.

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 091/036

1B. SOLAR FORECAST
17 May 18 May 19 May
Activity Low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 090/034

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: unsettled to active

Estimated Indices : A K Observed A Index 15 May
Learmonth 19 4434 3333
Fredericksburg 26 28
Planetary 30 30

Observed Kp for 15 May: 3356 4334

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
17 May 15 Unsettled.
18 May 10 Quiet to unsettled.
19 May 10 Quiet to unsettled.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND

DATE LOW MIDDLE HIGH
16 May normal fair-normal poor-fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
17 May normal normal fair
18 May normal normal normal
19 May normal normal normal
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values. Spread F and
sporadic E may have degraded F layer communications from 05-13UT.

Observed T index for 16 May: 33

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
17 May 30 Near predicted monthly values.
18 May 35 Near predicted monthly values.
19 May 35 Near predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
None.

I just received my registration back from Citicorp today.
Citibank gave a free 5 year extended warranty on my Standard C558A HT (which
is similar to the way they treat CB radios and cellular phones).

>the steady power supply not the LED....shouldn't I add the capacitor
>in series with the CB instead?? Or do I need some kind of low pass
>filter? Any clues?

>Thanks for your help.

Well I have to agree with you in that you may just need a lowpass filter for the CB. However I would NOT put a capacitor IN SERIES with the CB's power cable. You may find your CB wont work at all, since this is a highpass filter which blocks the DC that you so very need to run your CB. A capacitor in PARALLEL across the positive and negative power leads of the CB is a lowpass system that you may be looking for. Try about 1000microfarad across the power leads (take care with polarity) to filter out any high frequency interference above DC frequencies. Better still use a filter choke (a large inductive coil) in SERIES with the positive power cable of the CB to achieve a lowpass filter once again. A couple of tens to hundred microhenrys to 1 or 2 millihenry could do the trick, depending upon the severity of the interference. You could try a combination of both if the problem is really bad. Most car stereo outlets sell these filters as ready made units with varying degrees of effectiveness. Usually the more you pay, the more elaborate the filter design becomes, the more effective it is.

Check this installation with the cars electrics first. Some modern day cars with the computer system controls and the whizz-bang electronic technology may not agree with the loading that these external components posses. Ask someone in the know if it's O.K.

Good luck.....

2205. Ham Radio few problems!

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-17 00:41:02 UTC
From: jeffj@cbnewsm.cb.att.com
Message-ID: <Cpx8Kq.L3A@cbnewsm.cb.att.com>
Source record: 266910

There are times when I read this newsgroup that it seems like numerous subjects on the problems of Amateur Radio are being posted at the same time. If I or someone outside (inside?) of Amateur Radio just read these subjects they might get the wrong impression that our hobby is riddled with all sorts of problems! When I first became a ham radio operator I fully expected that 99% of the hams would be great and 1% would be idiots. I haven't been disapointed! 8-) In fact I was pleasantly surprised to find that it was more on the order of a .01% idiot factor. Is Amateur Radio a perfect world? No, but it is far better than most anything out there that is comparable. Any one else agree or disagree with me on this?

Jeff

YEah... they say "QSL" all the time (which is not intended for voice modes -- especially VHF/UHF) and is improper in the way which it is used.

And the same ones that are always "destinated"

And the same ones that give a "5-by-9" report to someone wanting a signal check.

Need I go on....

To the best of my knowledge, the only requirement is that they
have a bona fide U.S. mailing address. You could be his.

2208. HF SKED Anyone?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-17 01:34:20 UTC
From: cxn2624@u.cc.utah.edu
Message-ID: <2r96us$lcp@u.cc.utah.edu>
Source record: 266912

Hi This is KG7TE calling CQ, does anyone want to have a sked
on HF? I have a 6 element mono band beam at 70 feet for 20m.
A delta loop for 40, So I prefer those two bands but go elsewhere.
Please let me know, and if anyone wants to chat I will be on
14.155 Thursday evening at around 2:00ZULU

Thanks
Jon

Greg Bullough (greg@netcom.com) wrote:

: Gee, perhaps the DXpedition could start out by calling a friendly
: 'break,' using the occasion to check out their set-up, and then
: ask for control of the frequency when the QSO is over. A 15-minute
: rag-chew probably isn't too much to pay for getting established on
: a frequency, now is it? In other words 'if the frequency is in use,
: perhaps you can join them rather than beating them!'

This is a very good point. Sheesh, I doubt that 1% of ragchews on HF
last more than 15-20 minutes anyway. Propagation rarely allows it.

: > If you start a ragchew on 14192 you are not likely to be asked
: > to move, but if you start one on 14195 there is a bigger chance
: > that you will be, so why not recognize that 14192 is a better
: > place to start out?

: Because if every casual operator (who have just as much rights to the
: bands) keeps a list of every frequency which is someone's or some group's
: 'favorite,' and avoids it, we now have bands with 100 'edges' instead
: of the current 9 or ten per band. Between nets, quasi-nets, and bulletin
: frequencies, it's already tough enough for the casual operator to enjoy
: his or her hobby. Oh yes, let's not forget the 'satellite' sub-bands which
: are now springing up, even on 15 meters! We need to reduce to a minimum
: the number of 'reserved' spots which the hobby recognizes, and operate
: on a 'first-come-first-served' basis unless there is compelling reason
: to do otherwise. And we need to recognize that a clear channel for the
: convenience of DXing is NOT a compelling reason.

Beautifully said. For 99% of us, amateur radio is a casual hobby, not a
full-time occupation. We learn the rules per part 97, we learn courteous
operating procedure, and that should be enough. All these highly
intricate quasi rules simply serve to increase tension and decrease the
enjoyment of the hobby. Most of us don't know these little would-be
rules anyway.

: > ..... it is combative to start a QSO
: > right there when there are other frequencies available.

: Only if the frequency.police MAKE it combative. What if, rather than
: being asked to clear the frequency, the person who called CQ on 14195
: was invited to wait for DX together, during a rag-chew? 'So, over to
: you Jeff, and we'll listen for any DX breakers on the turn-over. WA8DX,
: this is WA6DCL/2 over and QRZ DX.'

Exactly the point. Those whose single minded pursuit of one narrow
aspect of the hobby (DX for instance) should not expect the rest of us to

unconditionally defer to them. I doubt there are many instances of
casual users not being cooperative when asked to move a few Khz from say,
a net freq. But, for example, don't these DX stations to which Derek
refers have VFOs on their radios?

: Seems simple, doesn't it? Wouldn't it then encourage DX stations to
: join in? Wouldn't it give them something as a point of reference?
: Couldn't the stations rag-chewing then turn over the frequency to the
: pile-up? Or other stations break with information on when Outer Mongolia
: comes on the air, and where?

: For God's sake, if people just stop yelling 'mine! mine!' and actually
: take the time to *TALK* to each other, the solution comes up and smacks
: them in the face.

Well said.

2211. Atlas 210X Info Wanted

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-17 02:21:38 UTC
From: leigh@coyote.rain.org
Message-ID: <leigh.769140754@coyote>
Source record: 266917

I've been loaned an old Atlas 210X HF transciever, and have an option to buy it for a mere 50 dollars.

Using a dummy load, it puts about 50 watts of CW out. But using a Hustler 40 meter coil & whip, power drops down to about QRP levels, even though the SWR is around 1.5:1. An old-timer with experience with the Atlas says this is fairly common; he says the early solid state rigs did not like loaded whips, and required a special matching network. (He also says that a conventional antenna tuner won't work.)

Evidently part of this required matching network included a large air coil. Any idea where to find or buy this item? I'd like to use this as a (parked) mobile CW rig, if I can get the power up.

Also, on the large selector knob on the front panel, there is a setting marked "CAL". I can find no mention in the manual as to what "CAL" is for. Any ideas?

Any other input on the Atlas 210X would be appreciated. Yes, it's certainly not the equal of my Icom 735, but the price is right for a mobile rig that might be at risk for being stolen.

What is the internal resistance like on these LiH cells? I know that Alkalines
flutter under high power TXing. Also, I seem to remember seeing an ad for
magnesium (?) batteries meant to be used in those old Army field phones.
It also claims a 10 year shelf life. Anyone know more about this?

>sorts of problems!

I'm currently an outsider, having just recently taken an interest in
amateur radio. That's why I've been reading this newsgroup.

Obviously, the hobby is riddled with problems! *EVERYTHING* is riddled
with problems. [Check out comp.os.386bsd.* for example.] If I didn't
see people here griping and moaning about things, I would think you were
all a bunch of zombies who weren't actually *doing* anything. Instead
I see lively discussion.

It is human nature (and especially prevalent on USENET) to complain
about problems. Things that aren't a problem just aren't noteworthy.
For example, I set my radio to 5.000 Mhz and heard this guy telling
me what time it was. Anybody want to have a long discussion about that?
Ahhh, but if I heard 2 Live Crew, *that* would be noteworthy!

b.t.w. It seems a lot more friendly and polite here than in many of
the other hobby oriented newsgroups. This is good. :)

I think you're overreacting. Apart from the fact that some Region 1
broadcasters seem to target Region 2 listeners, both the hams AND the
broadcast stations are legitimate users of the band.

Listeners in Region 1, listening to a very much more powerful broadcast
station are unlikely to be seriously bothered by a couple of 200 watt cw
stations slightly off frequency in Region 2.

If the broadcasters don't like that, they can always move out of the ham
and swbc shared part of the spectrum.

2217. Re: PL Tones

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-17 03:29:38 UTC
From: sohn@ccnet.com
Message-ID: <2r9dn2$kt7@ccnet.ccnet.com>
Source record: 266919

The original layout was based on the decoding bandwidth of the first mechanical reeds. On any one RF frequency, only tones from the same letter group (A,B,Z) were to be used. This ensured that no two tones would be too close together and experience false decodes from each other's use. This is still somewhat true today. Even though mechanical reeds are clunky and old-fashioned, they are still a VERY stable, high-Q device. Many solid-state decoders actually have wider decode bandwidths than reeds do!

The "letter group" concept also carried over into audible (paging/signalling) tones as well. Only tone from the same group were to be used on any one RF frequency. Many paging company operators found that tone groups used by the various vendors would not necessarily co-exist on a given RF paging frequency.

In digital coded-squelch, the coding is done digitally, except a turn-off code of 134.4 Hz is used at the end of each transmission for quick decoder turn-off. RF frequencies that have digital coded-squelch users can't also properly support a 136.5 HZ (4Z) user since the end ofevery digital coded-squelch transmission would likely cause the 136.5 user's squelch to open momentarily.

The 3-Hr Ap Indices for 15 MAY 94 are: 14 15 54 80 30 15 20 23
Greater than 2 MeV Electron Fluence for 16 MAY is: 3.9E+08

SYNOPSIS OF ACTIVITY

Solar activity was very low. Region 7723 (N05W26)
was the only flare producer with a pair of B-class subflares
over the past 24 hours.

Solar activity forecast: solar activity is expected to be
very low to low. Region 7722 (N08E12) still has the best,
although slim, chance of producing C-class flares.

The geomagnetic field has been at unsettled to minor storm
levels over the past 24 hours. High latitude stations saw

active to severe storm conditions. Activity is most likely because of a well positioned coronal hole. Energetic electron flux (GT 2 mev) ranged from normal to high levels through the period.

Geophysical activity forecast: the geomagnetic field is expected to be unsettled to active levels in middle latitudes and active to minor storm levels at high latitudes for the next 24 hours. Activity is expected to subside to mostly unsettled thereafter.

Event probabilities 17 may-19 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 17 may-19 may

A. Middle Latitudes
Active 20/30/20
Minor Storm 25/20/10
Major-Severe Storm 10/10/05

B. High Latitudes
Active 25/25/25
Minor Storm 25/20/10
Major-Severe Storm 10/10/05

HF propagation conditions were near-normal for the low and middle latitude paths. High and polar latitude paths were generally below-normal with an excursion to useless propagation conditions for transpolar and transauroral paths between approximately 12:00 UTC and 15:00 UTC due to a period of major to severe geomagnetic storming during that interval. Conditions then improved throughout the remainder of the day and were beginning to approach near-normal values by the end of the UTC day. Additional periods of minor signal degradation may be observed over the high and polar latitude paths over the next 24 hours. Conditions should begin improving more solidly over the next 24 to 48 hours as this disturbance subsides toward quieter levels.

I need to gather some info on building an antenna for short
wave reception? Please excuse my ignorance, I am very new at
this. Someone told me that All I need to do is connect a very
long thin wire from an adjacent tree to the house and one from
the ground and connect them into the adapter that goes into the
external antenna plug. I have some questions:

1) How long should this wire be? Is it somehow related to the
frequencies that I am interested in? What if I am interested in
more than one?

2) should the wire be shilded or unshielded?

3) what should be the gauge of the wire? The thicker the better?

4) should the wire be the meshed type or a single thread?

: >
: >
: >: Jim Hollenback, WA6SDM
: >
: >FWIW, the only one of those freqs I'd ever heard of was 14.230.

: Then you need to put up a better antenna. The maritime net on 14300 kc
: has been around for at least 20 years handling traffic, WX and phone
: patches for sailors in the Pacific. Back in '82 I sailed a boat from
: Hawaii to San Francisco and checked into that net daily - they provided
: phone patches to the Weather Service and to my parents daily.

: At any one time there are dozens of sailboats plying the Pacific and
: 14300 provides a lifeline for them. Distress and medical calls are
: handled periodically on there. The Coast Guard will, when necessary,
: put their 10kW xmtr on 14300 to directly handle a distress call.

I've used the maritime net several times, both by running traffic from sailboats, and from a sailboat. Have done a lot of things over the past 28 years of amateur radio.

But chum, if someone gave me a pop quiz regarding what freq they operate on, or what times they are on it, no way would I get the answer right. I'll bet you a six-pack of budweiser that 99% of all hams are in the same boat :)

And that's the point: we listen, we ask if the freq is in use, and if it ain't, then it is free for use which is legal per part 97. As I have said (and as many others have said) on this thread, if a station broke into my qso (as happens more often than I wish it did) and said that they were about to start a net on the freq in question, no problem about yielding the freq although it would be my right not to do so. I can't remember a time when I heard an amateur refuse to yield under similar conditions. On the other hand, as Jack Nicholson said in "A Few Good Men"--"First you have to ask me nicely." :-)

What got this thread going originally was an observation by someone that often those who wish a frequency yielded to them are not polite. They don't ask nicely. They are indignant that anyone would be sufficiently combative (yes, the word was used in exactly this context)to dare to use this or that freq which some narrow segment of the hobby, whether it be traffic handlers or dxers or just good old boys, consider their own. This attitude is not appropriate.

Here in the US, and particularly in Southern California, there are many many many people upgrading to general, advanced and extra by way of the new no-code entry-level license. I suspect that these ops (good ops, by the way) will be less enthusiastic about some of the so-called conventions which some of us old timers may feel apply to this or that frequency. Probably they won't even know about 'em.

Should be fun.

>on which frequencies; no one below the Federal level has such authority.

Except that local authorities don't give a good god damn about law. What
they care about is their authority. Which they maintain by doing what they
want to do anyway, thus putting their 'victim' in the position of having
to go through the legal system to get justice. They know full well that:

a) even if they 'lose' in the legal system, by putting
the 'subject' through the system, they have exacted
punishment in the form of time, stress, and financial
costs. This will teach the person not to 'mess' with
them in the future
b) there is little consequence for such abuses of authority,
as the cards are stacked in favor of 'the system' as
regards liability and compensation

: mode? When will it be available? Should I hold off buying a multimode
: controller until this mode is available?

: tnx es 73 de KB2PWM, Steve Goldstein

Pactor II is a major revision of Pactor I (known as simply "Pactor") It will allegedly feature thruput similar to that of Clover. It will, it is said, also feature multiple tones (i.e. more than 2 toned FSK) which will mean that the popular TNCs of today will not support it.

Whether Pactor II will catch on is highly doubtful. Because of the likelihood that to use it you will need a new and expensive TNC. This is why the Clover mode, which also has better thruput than Pactor or RTTY, has failed to catch on with most digital hams.

Kantronics has come out with a new mode called GTOR, which features dual-tone FSK and thus is compatible with all multimode TNCs (to the best of my knowledge). It is presently only offered by Kantronics, although they have offerred to license it to the other TNC manufacturers. There is controversy as to whether GTOR performs at or near the level of Clover (don't ask me, I use an AEA PK232 :-))

Bottom line: heck no, don't put it off. Get a TNC and get up on digital! It's too much fun to put off waiting for the next mode. There's ALWAYS a next mode! :-)

Hi, for those who might care :

TM6JUN - will be set up during the celebration of D-Day 50th anniversary.
At least five special QSL cards have been edited.
The station will be located in Utah Beach, Cotentin and will be operated by
multi-national hams, from June 4th to June 11th.

Frequencies :

CW : 3.554 , 7.030 , 14.044 , 21.044 , 28.044
SSB : 3.775 , 7.070 , 14.244 , 21.344 , 28.444
VHF : 144.244 and satellite traffic.

QSL via F6KFW, BP 234, 50102 CHERBOURG CEDEX, France.

Best 73 and good luck !

Vincent, F1RCS.

SB RAC @ CANADA < VA3RAC $RAC_9405.15
RAC NEWS BULLETIN 05-94 INTERNET EDITION - 15 MAY 1994
Issued at RAC Administrative Office
P.O. Box 356
Kingston, ON, K7L 4W2
Internet Editor: Cam Inglis <INGLISC@GTM-INC.COM>
Internet Transmission: Steve Cutway VE3GRS <CUTWAYS@QUCDN.QUEENSU.CA>

ITEM 01. AMATEURS AND ANTENNA STRUCTURES

At a recent Canadian Amateur Radio Advisory Board (CARAB) meeting, Radio Amateurs of Canada (RAC) was informed that Industry Canada (IC) will develop a package of documents explaining the policy and procedures implemented by the government with respect to the erection of antennas and antenna structures, which can be distributed to the public. It is expected that the package will be available when the Canadian Environmental Assessment Act (CEAA) is proclaimed in the fall of 1994. Also included in the package is an article prepared by RAC suggesting guidelines for the erection of antenna structures.
ITEM 02. PROTECTION OF FREQUENCY ALLOCATION 220-222 MHz

The public comment phase of the 30-960 MHz review has concluded and the comments are now part of the public record. IC expects that any decision concerning the potential re-allocation of the 220-222 MHz band will be announced by the fall of 1994. Interested parties are encouraged to review the public comments that were received. RAC has registered its objection to this proposed re-allocation.

IC met with the Federal Communications Commission (FCC) to work out a proposed sharing arrangement that is independent of whatever may be the final allocation of this band. IC is working with the FCC on a mutually acceptable sharing arrangement along the international border corridor. RAC advised and assisted IC in the work associated with the proposed sharing arrangement.

ITEM 03. PIERRE ROGER VE2TQS JOINS ADWG

Radio Amateurs of Canada's President Farrell Hopwood VE7RD, and RAC's Quebec Director Jean-Guy Riverin VE2JGR are pleased to announce the appointment of Pierre Roger VE2TQS to the Amateur Delegation Working Group (ADWG). Pierre is employed in the engineering department of Reseau Quatre Saisons, a French language TV network. He is also vice-president of Radio Amateur du Quebec Inc. (RAQI). He has been an Amateur Radio Operator since 1976.

Pierre joins Jim Dean VE3IQ, Ken Pulfer VE3PU, Doug Frame VE3JDF and Industry Canada officials on the ADWG committee. They are currently working

on the proposed delegation of some elements of the administration of the Amateur Radio Service.

ITEM 04. NEW MOBILE DF EQUIPMENT QUICK AND ACCURATE

Canadian radio frequency inspectors are finding their new OAR directional finding mobile systems quick and accurate in pinpointing radio interference sources. According to an Industry Canada newsletter, 34 systems were purchased for district offices across the country.

In Ottawa recently, a department inspector responded to a report of harmful interference. Using the new equipment, the offending signal was traced to a shopping mall. A low power transmitter was located after just one minute of transmission time.

ITEM 05. ONTARIO CLUB CONSIDERS ADOPT A HIGHWAY PROJECT

The Ontario Ministry of Highways has approached the London Amateur Radio Club to see if there is any interest in the club adopting highway 403 just outside of London. Club members would be assigned sections of the highway to keep clean. They would receive safety training for the work and would be expected to clean up litter at least three times a year. In return, the Ministry would post a visible sign along the highway, giving the club credit for caring for the highway and advertising the club repeater frequency.

ITEM 06. NEW EDMONTON AMATEUR GROUP IS BORN

Edmonton has a new Amateur Radio Club called The Radio Amateur Educational Alumni Association (RAEAA). It was formed under the banner of the Amateur Educational Society (RAES) which began in 1991. RAES says that after just two years of offering Amateur Radio training courses, they will have graduated over 170 students. The successful students are behind the new club.

The club repeater station VE6RES has been on the air since last July. The group also staffed a demonstration station at Edmonton Klondike Days last July, operating 12 hours a day during the 10 day event. Ron Gordon VE6RLG is President of the RAES Alumni Association.

ITEM 07. LOS ANGELES EARTHQUAKE AND AMATEUR RADIO

Gary Jacobs VE6CIA, of Red Deer, Alberta, got a first hand view of the January 1994 earthquake in Los Angeles. As a Red Cross emergency co-ordinator, he joined more than 13,000 volunteers to help feed and shelter victims of this disaster. Describing events on Monday, February 15 he says: "it rained heavily causing mud slides in Malibu again. There was so much snow in the Sierras causing avalanches that roads closed, a tornado touched down in Tusca and there were 85 vehicle accidents on wet L.A. streets."

Reporting in the Calgary Amateur Radio Association Key Klix bulletin, he says, "The experience was great and I would recommend taking the opportunity should you get the chance."

W5YI Bulletin reported that the Red Cross stationed Amateur Radio operators at more than ten shelters to handle most of the health and welfare

traffic. Their report says that RACES, ARES, Salvation Army and Red Cross hams worked closely together, with everyone remaining cool, calm and collected. The 147.705 repeater in Southern California handled most of the earthquake health and welfare traffic, according to the report.

Several repeaters were silenced due to lack of electricity. Others with battery, solar or generator power were dedicated to emergency and health and welfare traffic. With telephone service cut off, many stations up and down the high frequency (HF) band were relaying out-of-state phone calls into the devastated area.

ITEM 08. HELP AVAILABLE FOR IMPROVING YOUR CLUB BULLETIN

The Amateur Radio News Service (ARNS) is an organization of Amateur Radio newsletter editors and publicists. They produce the ARNS Bulletin to help newsletter editors better promote Amateur Radio by improving their club publications. ARNS is open to anyone sharing the organization's goals.

ARNS Bulletins are full of news, ideas and suggestions on improving your club bulletin. For more information, contact Pam Myers N8IAK, 510 West Harrison, Alliance, OH 44601.

ITEM 09. VE2 INCOMING QSL BUREAU NEEDS HELP

On August 1, 1994, after 23 years, Al Daemen VE2IJ, will be retiring as Manager of the VE2 Incoming QSL Bureau. Volunteers are urgently needed to resume this work. If you are interested, contact Al at (514) 737-3736.

ITEM 10. 50th ANNIVERSARY NO. 4 WIRELESS SCHOOL SPECIAL PREFIX

Industry Canada has announced special prefixes for the 50th Anniversary of the No. 4 Wireless School (RCAF). Special prefixes may be used by Amateur Radio Operators in Haliburton, Ontario area for the period May 15 to June 15, 1994. VE3 Amateurs may use VB3, and VA3 Amateurs may use VC3.

In conjunction with this event, a station will be set up at Pinestone Lodge May 27 and May 29, 1994, and will use the callsign VD3WAG.

ITEM 11. AMATEURS REMEMBER D-DAY JUNE 6, 1994

Radio Amateurs of Canada wishes to remember and honour the men and women of the Allied armed forces who took part in the invasion of Normandy fifty years ago to open up a second front in Europe on June 6, 1944. RAC especially wishes to honour and thank the many radio operators serving in the Army, Navy and Air Force for the major contribution they made in defence of freedom in those dark days of sacrifice and suffering during World War II. Many were, or later became, Amateur Radio Operators.

In his book "Most Secret War", R.V. Jones tells of the extraordinary contribution made by experienced Amateurs as training recruits in radio, operating radio and radar equipment and manning the secret listening stations involved in military electronic surveillance and espionage. To those who are now "silent keys" our remembrance in gratitude. To those still with us, our deep respect and sincere thanks for the precious gift of themselves in defence

of our freedom.

Submitted by RAC's President Farrell Hopwood VE7RD.

Industry Canada has authorized special prefixes to mark the 50th Anniversary of D-Day. They were printed in this bulletin March, 1994.

ITEM 12. 50th ANNIVERSARY OF HMCS HAIDA SPECIAL PREFIX

Industry Canada has authorized a special callsign CI3CGJ for the period May 24 to June 6, 1994 to mark the 50th Anniversary of the battleship HMCS Haida.

ITEM 13. UPCOMING EVENTS WE'VE HEARD ABOUT

The annual Central Alberta Radio League Father's Day Picnic and Hamfest will be held at Burbank Park Campground on June 17, 18 and 19, 1994. The location is a few minutes north of Red Deer on Highway 2A near the junction of 597.

The first National Convention of Radio Amateurs of Canada will take place in Calgary, Alberta, July 29 to 31, 1994.

The Brantford Ontario Amateur Radio Club will be operating a special event station VE3BA from 1400 to 2000Z on June 4 and 5, 1994 from the Bell Homestead to commemorate the 120th anniversary of Alexander Graham Bell's invention of the telephone at this site in the summer of 1874. Approximate frequencies will be 7.170, 14.170 and the club repeater 147.150.

The Quinte Ontario Amateur Radio Club Hamfest and Computer Show will be held Saturday June 18, 1994 at Dick Ellis Arena, Harder Drive, Belleville, Ontario.

The Central Ontario Amateur Radio Fleamarket will be held in Kitchener, Ontario on Saturday, June 4, 1994. The location is Bingeman Park at 1380 Victoria Street North.

ITEM 14. QSL BUREAUS

The rule changes for the Outgoing QSL Bureau have caused some controversy, even though they are similar to the practice and procedure used by Outgoing Bureaus in other countries. RAC members should remember that the bureaus are not self supporting. Cost to RAC to maintain both the Incoming and the Outgoing Bureaus is some $8,500 a year and is likely to increase given postal rate fluctuations and the large number of amateurs who are joining our ranks. It is quite common in other countries for QSL Managers to be charged a "user fee" to offset the large number of cards which are sent through the Bureau.

Radio Amateurs of Canada recognizes that the new bureau rules have generated some discussion and as such are holding the new procedures in abeyance until they can be discussed at the next RAC Board Meeting in July. Cards for the bureaus should still be sorted in the correct manner, but the rules with respect to qsl managers and the destruction of the cards are in

abeyance until they can be reviewed by the board.

Those RAC members who have comments on the proposed rules should forward them to their respective directors or to Tim Ellam, VE6SH at 307 Christie Knoll Point S.W., Calgary, Alberta, T3H 2V2 or via packet at VE6SH@VE6YYC or on Internet at TIM.ELLAM@LOGICAL.CUC.AB.CA

ITEM 15. AMATEUR RADIO A VITAL RESOURCE

A stock of these new videos has arrived. Contact RAC office for details.

ITEM 16. D-DAY SPECIAL EVENTS ANNOUNCEMENT

The American Association of D-Day Utah Beach Radio Amateurs and the French Manche Amateur Radio Society will be operating two special event stations June 4 to June 11, 1994 to commemorate the 50th Anniversary of the Landing of the Allied Forces in Normandy, France on June 6, 1944.

Station TM6JUN will operate from Utah Beach (landing point of the Allied Forces) June 4 to June 11. Check 3.544, 7.030, 14.044, 21.044 and 28.044 MHz on CW. Planned phone frequencies are 3.775, 7.070, 14.244, 21.344, 28.444 MHz. VHF frequency 144.244 MHz (QRV on satellite too).

QSL information: F6KFW via F-Buro or Radio Club F6KFW, P.O. Box 234, F-50102, Cherbourg, France.

Station F6REF will operate on Sunday, June 26, 1994 from 8:00 to 24:00 from Servigny Castle in Yvetot-Bocage. tab QSL information same as above.

Dr. Loomis was a dentist. If I remember correctly, he used a non-powered system where he simply connected his "transmitting" antennae to ground via a telegraph key. I assume that at all time a very small potential difference existed between the antennae and ground, when the key opened and closed, a small current flowed and excited the antennae at its resonant frequency. I'm not sure what he used as a detector, but it did work.

I read about this in one of the ham magazines over ten years ago, so I can't remember all the details.

Often you can see this effect with a TV set. Connect a set of rabbit ears to a TV set and tune in a weak station. One that is right on the verge of snow, but not too bad. Then cut a metal rod to about 1/4 wave at the appropriate frequency. Hold this rod in the plane of the rabbit ears (same polarization) and tap the rod with a metal screwdriver. Many times you can get "sparkles" in the picture by doing this.

Source record: 266943

After reading Greg Bullough's reply, I find that I cannot agree more. I am rather annoyed with those who decide a particular frequency is for a particular use. If you want a frequency, wait until it's clear and then use it! If you don't want to wait, move to a nearby frequency and later move to your pet number when it clears.

The other side of this coin is the contest situation on weekends. As a relaxed rag chewer, I find the contest people rude and aggressive. What's worse, they are ubiquitous! I simply cannot find a clear frequency to have a conversation. If I wait long enough I can find a hole and jump in with high power and call CQ. But I get no answers because all the others like me have turned off their radios in disgust.

I have asked many times if those who set up contests would please leave space on each band where those who don't choose to participate could congregate and enjoy the traditional aspects of this wonderful hobby, things like conversation and message handling and so on. But I get mostly rude replies, inviting me to join in with the phony 59 reports and numbers that have no meaning to me.

A lesser annoyance is the continual request for 10-10 numbers when operating on 10m. I don't have a 10-10 number and have no plans to get one, and I am happy to so state. But it's one of several reasons I operate very little on 10m. It's a good band when it's open, but I usually opt for frequencies above 28.5 MHz when I get on there. I do a little CW at the low end, and that's fun too. Repeater operation at the high end, above 29.5 MHz, is fun but seems a bit silly since I can usually hear the other guy direct better than through the repeater (for simple technical reasons that I won't go into here).

The bottom line is, let's all have fun and not tread on one another! If you get so wound up in one aspect of the hobby that you get annoyed with those who don't share your interest, then it's time to think about why you are doing it and put yourself in the position of those who are at the other end of your vitriol.

I'm not trying to annoy anyone here, just some food for thought.

>European postage with two greenstamps. Yesterday, I received the two EI7M
>cards and one of the greenstamps.

Hmmm, did you really get the cards back through EI5HB? EI7M's
manager is EI5FT, who I recently received my card from.

For a short while, W6GO mistakenly listed EI5HC as the manager, but
corrected it last month.

If you did get a card back from EI5HB that could explain the confusion
with HC.

Another QSL nice guy is VP2VF. Seeing that he must work every Ham
on HF there is, I decided to include both an IRC and a greenstamp to
defray the cost of printing the cards. Well, with his card came
the IRC I sent.

Speaking of postcards, I haven't seen Gary C. posting lately, is
he on vacation?

Note that the FAA rule says the PILOT, not John Q Public, who has not already been certified as a pilot. And in my first comment I also stressed that the Part 97 wording applies ONLY to licensed stations, not John Unlicensed Public. Some folks appear to be quoting far more than what is printed in black and white.

As I said the first time: Was it legal? NO. Should you do it again? Absolutely!

>In Australia that would cop you a $10,000 fine and/or gaol.

In the US, it's perfectly legal.

>Let's distinguish between transmitting out of band (OK) and having the
>ability to transmit out of band (annoys the authorities).

Let's distinguish between US and Australian law.

It was legal for him to posess the transmitter. It was legal under
US law for him to use the frequency to call for aid. Period. The fact
that the Sheriff got pissed off is their own problem. What we have here
is the Sheriff department abusing their authority to confiscate property.
The unfortunate part about the US is that it takes more money than a
hand-held is worth to get the legal system to work.

This 14300kc interests me. First, I guess the author really meant 14.3
kc.
Also, I guess that kc was used because it is supposed
to show a long term connection with radio. However, kc was always
incorrect as used because it was always supposed to be kc/s. A time
unit has to be provided to give a proper frame of reference. 14300
kilocycles doesn't really provide any real useful information. One of the
reasons that hertz is used is because it is a unit for cycle per second.

This kind of identification with "the true antiquity" of radio by
using quaint "older" terms. Always reminds me of being in the Army and
being trained by older NCOs who always talked about the good old days
of the "brown shoe" army when "men were men" and everything was just
a lot better. I guess the Kc is supposed to show that the poster came
from a time when "hams were ham" and modern changes didn't affect the
hobby. Or maybe I'm just being too critical of a slip.

ARLB044 Rules petitions denied

Rules petitions denied

The FCC has denied two petitions for reconsideration that sought a broader definition of permissible communications by amateurs.

The petitions, by David Popkin, W2CC, and Rolland D. Cummings, WA0EDA, sought expansion of FCC rules changes that went into effect in September 1993, in PR Docket 92-136. Those new rules, the result of an ARRL proposal, gave amateurs greater flexibility in providing noncommercial communications for public events and permitted paid teachers to use Amateur Radio in their classrooms.

The new rules also allow personal communications such as making appointments and ''ordering pizza.''

The two petitions sought permission for amateurs to retransmit certain US government broadcasts, such as time signals. Popkin's petition also sought a wording change to the new rules, from ''classroom instruction'' to ''instructional activity.''

The FCC said that the ideas expressed in the petitions already had been aired and considered during the public comment period for PR Docket 92-136.

How about a nice, older HW-101 or IC-701 or Kenwood TS-120/130S?
Why only 2 meters? People just don't get it. VHF stuff is expensive,
and who wants older VHF equipment (for the most part)? Older HF stuff
is still very current and functional - and cheap, AND you can work
around the world with it. When did that cease to be the driving
force in amateur radio? Two meters IS all that's left :-(

I presume this will be first made available in California where it can compete with the grave sites that have a monitor and a video taped message from the deceased, for viewing by those who pass by and push the button.

You seem to have failed to take account of the FCC's vanity call sign proposal. If they go ahead and charge $70 for 7 years as some have proposed, then presumably the burial fee could include an annuity for perpetual renewal. However, some have proposed a single lifetime fee, with no mention of an afterlife fee.

BTW, will there be a code requirement for interment, or might an Extra have to spend all eternity lying next to a no-Code Tech?

Also, will there be a service to handle QSL requests?

2254. Help Needed: HW-18 Audio

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-17 19:44:00 UTC
From: johnk@ATK.COM
Message-ID: <2DD91EA1@msm.ATK.COM>
Source record: 266953

Subject: Help Needed: HW-18 Audio

I am restoring a Heath HW-18 HF SSB transceiver and have seen an anomaly in the received audio. At high volume levels (the gain control at 3 o'clock position or higher), the audio output goes into what sounds like a low frequency oscillation (perhaps 30-40 Hz). The AGC is audio derived, and I am suspecting some sort of unintended interaction in that circuitry (due to aged components) between the recovered audio and the RF/IF stages. Due to time constraints, I have not yet analyzed the circuitry nor put a scope on it. I notice at first glance that there is a large 10 ufd 350V electrolytic in this loop, and I would intitially suspect this may have dried out, but that assumption is unsubstantiated. I'm hoping someone else has seen and fixed this.

The HW-18 is / was a crystal controlled version of the HW-12 / 22 / 32 series of Heath 180 watt "Mono-banders", designed for MARS, CAP and 160 meter operation (three different "dash" numbers). It used the same PC board as the other models, and merely substituted a crystal controlled oscillator for the VFO. I am wondering if anyone who still has one of these models has seen (and fixed) a similar problem.

I would appreciate Internet responses directly to: johnk@atk.com

If you are responding from the Washington-Baltimore area, my switched network numbers are: voice 410-266-1853 and fax 410-224-0887. Thanks.

>says that a conventional antenna tuner won't work.)

The loaded whip, even when resonant, will have an impedance much lower than
50 ohms. One of the accessories originally available from Atlas was an
impedance transformer to raise the impedance of a mobile whip. You could
probably make one using a large toroid core. But there is no reason a tuner
shouldn't work if it properly transforms the whip impedance to 50 ohms.

I used an Atlas 210X last year when I was operating in Nicaragua
as YN1ASW. I used an MFJ 949E tuner to load a variety of antennas. I
did have one difficulty, and that was parasitic oscillations that developed
on some bands as I increased the power level. I determined that these
oscillations were due to the fact that any particular load, whether coupled
directly or through an antenna tuner, might present a complex reactive
impedance at some frequency, even though it presents a resistive impedance
at the desired operating frequency. Such oscillations did nort occur with
a dummy load.

I was able to partially tame these problems by putting a one or two watt
resistor of several thousand ohms resistance in parallel with the antenna
tuner. At the desired frequency this would absorb a negligible part of the
output, since it was effectively in parallel with a 50 ohm load, but at
frequencies where the antenna and/or tuner looked like a reactive load
this contributed some damping and helped to stabilize the rig. This wasn't
completely effective for all antennas and power levels, but I had limited
access to parts for trying more elaborate solutions.

You'll probably also find that output is very sensitive to supply voltage,
and will be substantially lower at 11.8 volts than at 13.6 volts.

>Also, on the large selector knob on the front panel, there is a setting
>marked "CAL". I can find no mention in the manual as to what "CAL" is

This turns on the calibrator -- you should hear a loud signal every 100
khZ if it is working properly.

>Any other input on the Atlas 210X would be appreciated. ...

Hi Manuals had a rather good packet on the 210/215 at the time I acquired mine, in mid 1992. They had a number of factory modifications in the package. The earlier your particular 210X the more useful these will be, since most of the mods were incorporated into later production units. You'll have to send in your $2 for a Hi Manuals catalog to see if they currently have the Atlas info.

73 and good luck,

==========

I wrote this a few nights ago, right before my license came.
KE6GXD, eventually to be found on 40 meter CW. Reply to
davev@atkc.com

I passed my Tech license exams in February, but am still waiting for my
ticket. I bought an ICOM IC 720 A through a posting in rec.radio.swap,
completely sight unseen of course. I had never even seen a 720A before.
I picked the rig based on what small amount I could afford and old
ARRL information on harmonics suppression. Choosing a rig by TVI.
It arrived at the office on Firday. Like a kid, I was opening it up at
the main reception lobby where it was delivered. It was much smaller
than I imagined it would be. One of the vice presidents of the company
walked in. "What is this," she asked, and wanted to know if the company
was being billed for it. I expained what it was, and then she told me
to clean up the mess.

Friday afternoon at the office drifted on by blissfully, with visions of
code practice from something other than Super Morse and other random
QSO generation programs, then came the BUSINESS DINNER FROM HELL!!!
Till 11:30 at night. No time to unpack my new toy then.

Saturday morning, bright and early, five hours sleep or not, I was raring
to go. I had the rig, but no power supply and no antenna.
After going through the electronics junk drawer and after a trip to
Radio Shack and to Albertson's for a gallon of milk for the baby, I
had a 12 volt 2 amp supply and a simple long wire antenna tucked under
the balcony of my first story apartment. When I fired the rig up, I
got nothing but static and the faintest cracklings of one station
around 15.2 MHZ in Spanish. Not even WWV! I knew the location had
a power lines about 60 feet away, but it couldn't be that bad. What
seemed worse, every time I changed bands, the rig made four clacking
noises like it was going to pop. "Oh my gosh, " I said to my self.
"I've been suckered. $400 down the drain, and there is nothing I
can do." Somebody I've never met hundreds of miles away has cashed
the check, and I am left with nothing. I got ahold of Bob, who I
know through my church and who is a general class operator. He said
his wife had some "Honey Do" tasks for him that would take a couple

of hours, but later he'd call me back and we'd try the rig on his power supply and his antenna.

Hours passed, very very slowly. It was about 7:30 at night. He called and gave me directions to his house. I quickly put the rig in a small suitcase, packed the mike, the photocopy of the manual that came with, and my improvised power supply in a bag, and I went on over to his place. He put the rig on his emergency power supply, a 12 volt marine battery he has on a solar trickle charger, plugged it into his inverted V up about 40 feet. It sounded fine on WWV 15 MHZ, and then we managed to get the rig tuned to 40 meter SSB, around 7.18. Bob, no longer just Brother Ruizak but now N6BNN, took the frail looking desk mike that came with the rig in his hands. The first QSO we heard, the operator didn't let the key up for about fifteen minutes, but finally he got a chance to break. Bob gave his QTH as Costa Mesa, California. The operator on the other end said he was in Arizona, and that the rig sounded fine. He even said that we were 5 by 9, and that he had a 720 A and that the horrible noise it made when I changed bands was normal.

"It worked" "It worked." What a relief. Then Bob passed the mike to me, and I was actually talking to another state on the radio. My first time transmitting on amateur radio! I was completely eccstatic, in bliss. Then a friend of Bob's heard us and broke in. "He's a sheep rancher in Mexico, about 1,200 miles away" Bob said to me before keying up, and then after answering the break he handed the microphone to my slightly trembling hands. I thanked him for the chance to talk, and asked him how it sounded. He said my voice sounded a little weak, like I didn't quite know how to best use that mike. Of course not, I'd never used it before.

Then another breaker came in. His QTH was Alabama. 2,000 miles. Incredible!

It was getting late, and his family called. He tried to transmit once on my improvised power supply. The meter went dim. Not enough juice to transmit. Well, at least I can't be tempted to transmit before my license arrives. As I carefully pack up my rig back in the suitcase I had so casually put it in before, Bob said that he thinks he has a straight key and an antenna matcher he will let me have for cheap and that he'll stop on by and see what kind of antenna would work best at my place. I thank him repeatedly and bid him good night. At home, I still can't receive anything and I still don't have my license, but at least I know why and I know I've even talked DX on my own rig now.

The same thing happens to my HTX-202 also. My Yaesu FT-530 power saver works
the way I would expect it to, I miss the first 3/4 second of a QSO. I don't
use the power saver on the 202 anymore. When I want to save power with it
I'll use the OFF switch.

> 4) should the wire be the meshed type or a single thread?

Stop bothering and start making life simple. Just take whatever wire you
have (preferably made of copper) and string it between two of something
(a house and a tree, for example). If you dislike the result, put it up
between two other things of something. Even better, put up two different
wires and test what gives best result.
That would give you a good start. When you know the results of all this
you may start elaborating on shields, gauge, threads and you name it.

Don't quit saving...HF is fun...but stay away from 80 meters at night.
40 meters seems a lot more civilized. And if you really want to talk
to "true hams" there are lots of 'em on CW.

By the way, I started this thread and I'm glad to see so many of you
have encountered the same kinds of hassles I have. Let's hang in there and
quit putting up with this kind of junk!

So you don't feel alone, I too had that problem. I don't think I ever had it that bad, but I know it was up to a couple of seconds at a time at least.

Other than that, I've had absolutely NO problems with my HTX-202.

MASSACHUSETTS QSO PARTY 1994

The 1994 Mass QSO Party is organized by Framingham Amateur Radio Association.

Contest period: 1800Z Saturday, May 21 to 0400Z Sunday, May 22 and
1100Z to 2100Z Sunday, May 22

Classes: Outside MA; MA single, MA multi-single, MA multi-multi, MA portable

Exchange: RS(T) and QTH (state, province, DXCC country, or Mass county)

Points: 1 point per QSO on Phone and 2 points per QSO on CW/Digital/Video.
50 points for Massachusetts Club Bonus Stations.

Multipliers: For stations outside Massachusetts, the number of Massachusetts
counties worked per band (max 14 per band).
For Massachusetts stations, states + provinces + DXCC countries
per band.

Scoring: Final score equals total QSO points times total multipliers.

Frequencies: CW - 1810, 3550, 7050, 14050, 21050, and 28050 KHz
SSB - 1850, 3890, 7290, 14270, 21390, and 28390 KHz
Novices - 3705, 7130, 21130, 28130 KHz

Awards : Certificate for the highest score in each contest class and for the
highest score in each state, Canadian province, and DXCC country.

Send logs by June 21, 1994 to Framingham Amateur Radio Association
P.O. Box 3005
Framingham, MA 01701

For full rules, send an SASE to the above address, or send a request
by e-mail to dave_hoaglin@abtassoc.com .

Jeff was referring to deliberately operating within a broadcast station's known "footprint." Seems to me that that's the same as the "Is the frequency in use" situation discussed elsewhere.

Very, very true. That does not mean that ALL 7100-7300 broadcast signals HEARD in North America are BEAMED to Region 2 -- and if they aren't, they're legal. That's my point.

>Also, if I'm conducting a QSO on a clear freq in that segment and
>suddenly get blasted to the moon due to an oncoming BC'er then
>who's the jammer? Hmmm, shouldn't Radio Phnom Penh have checked
>to see if the freq was clear prior to starting their beamed-to-Region 2
>bcst?

If they're beaming to Region 2, they shouldn't be there at all whether you are or not. If they aren't, then they -- as a broadcaster -- have NO obligation to listen on the frequency before starting a transmission. (They are, however, supposed to notify the IFRB of their intended frequencies, hours and beam headings/widths in advance.)\\\\\

During a repeater war between two repeaters about 75 miles apart
which insisted on using the same pair, with one upside down, the
winning side accomplished it by sneaking to the other town and
putting a small battery powered white noise generator near the
site. The resulting noise desensed the receiver so much the
repeater was unuseable unless you were close enough to hit it
with a snowball. None of the victims thought to use a non-FM
receiver for tracking possible QRM and thought the problem was
inside their hardware.

Do the same to this turkey. Render it impossible for him to hear
without even setting foot on his property. He'll soon tire of
talking to himself.

2269. Sell or Swap

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-17 23:17:00 UTC
From: william.eckle@twb.com
Message-ID: <bd.8565.170.0NC145AF@twb.com>
Source record: 266757

Hi All:
A friend has the following for sale/swap. Please respond to him directly or leave a message to me in this conference or E-Mail me at the address below, and I'll forward it to him. Thanks.

-=Bill=-

Internet address: william.eckle@twb.com

[1] VHF Transceivers for sale or swap.
From: Frederick Franz (WA6VHB)

I have for sale or trade two VHF mobile transceivers.

(#1) Icom-230, PLL, synthesized, 67 channels, 146 to 148 Mhz. This unit covers the bandwidth in 30 khz increments. This is the original band plan for 2 meter repeaters. E.g., 146.76; 146.79; 146.94, etc. The repeater offsets are -600 and +600khz. The radio also operates on any of the simplex frequencies, e.g.146.52; 146.55; 146.58 etc. The power output is 10 W. This unit features an analog type S meter. The radio does not have DTMF or PL (CTCSS), however there is a an accessory connector for 9V. power take-off and audio input. (I have used this for external DTMF and it works fine). The unit also has a jack for external speaker. Price is $100.00 OBO. (See swap info below).

(#2) Icom-280, PLL, synthesized, 559 channels. 143.9-145.995 Mhz in 5 khz steps. 146.01-148.11 Mhz in 15 khz steps. This is a later version than the Icom-230 for an expanded 2 meter band plan. The repeater offsets are -600 and +600 and the radio operates simplex on any of the channels. This radio has a dual power output selection of 10 watts or 1 watt. The frequency display is a 4 digit bright red LED type. This radio also has an analog type S meter, and a jack for an external speaker. Also featured is a 3 channel programmable memory. No DTMF or CTCSS. Price is $160.00 OBO. (See swap info below).

Both of the above mobile units come in factory boxes with manuals and accessories: mounting bracket; power cord; extra fuse; and hdwe. These radios are in good condition and I'll even pay the shipping!

I'll trade both of the above radios for a used dual band VHF/UHF radio such as the Alinco DR570T, DR592T or DR600T. (DR570T or DR600T preferable). Or if anyone has dual bander and doesn't want to trade, I'll offer cash. (The amount depending on condition, and if manual and accessories are furnished).

Please contact: Frederick Franz (WA6VHB)
1204 N. Ponderosa Circle
Payson, AZ 85541-3843

MID-ATLANTIC HAMFEST LISTING May 17, 1994

The following is a listing of known hamfests in the Mid-Atlantic area.
I will update this list as necessary. Please send any additions or
corrections to me at cps@access.digex.net so that others may benefit.

If you know of any hamfests not in this list, please let me know about
them so that they may be included in the next edition.

Hamfests that I know of, but need details: Gaithersburg, MD (Sept),
York, PA (Sept).

Thanks,

Chris Smolinski, N3JLY

Thanks a lot! The buoys I've got are all SSQ-23A, so it looks like
this will be a tremendous help! Now, all I've got to do is remember to
get down to the inter-library loan desk tomorrow...

2274. Good Electronic Texts

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-18 02:44:00 UTC
From: David.Edger@f239.n109.z1.fidonet.org
Message-ID: <0ae_9405172339@blkcat.fidonet.org>
Source record: 266975

I have come across some electronic textbooks that I think are
really pretty special. If you are studying for an amateur license
upgrade, or for a commercial radio license (like I am) and want to
really get a good understanding of electronics without an engineering
degree, you may want to give these books a look.
There are a series of nine books, all based on a military
electronic training course, which have been revamped completely for a
non-military audience. These books take you from zero to quite
proficient in each subject area with no fuss. The pace is fast enough
to keep the more knowledgable interested, but not so fast that you are
assumed to know anything that is not in the book.
Titles in the series include:
Solid state devices
Amplfiers
Propagation, transmission lines and antennas (my favorite)
Microwave
Wave-generation circuts, etc. etc.
Cost is $10.95 for each book plus shipping.
Order from Lathrop Publications, Box 207, Upper Marlboro, MD
20773.
He has ads in the most recent CQ and other ham magazines.
73, Dave AA5NU

Source record: 266731

Hi All,

PHD Hamfest is this weekend in Kansas City, and I need to make a
buying decision on this rig. Does anyone own one, and if so, what
are your opinions - pro/con?

Are there any problems with this HT?
Is the price reasonable (features etc)?
etc.. etc.. etc..

I have read the spec sheet, but have not seen one. HRO does not
carry Azden. Associated Radio (my favorite candy store) sells Azden, but
they do not have this particular unit in stock.

Any feedback would be greatly appreciated.

My favorite is Morse Academy, which can be found on Compuserve, AOL, and hundreds of BBSs around the country (including mine at 703-548-7849). It's usually named MA.ZIP, or MA51?.ZIP (where the question mark is the latest version, 't' at this time).

2277. Armed Forces Day Information

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-18 04:17:05 UTC
From: david@stat.com
Message-ID: <737Hmc19w165w@stat.com>
Source record: 266774

Here's the information, as I have it, for Armed Forces Day. Please note that the stations will be running a full 24 hours this year.

Armed Forces Day--This year marks the 45th anniversary of communications tests
between the Amateur Radio community and the Military Communications System. Special commemorative QSL cards will be issued to amateurs achieving a verified two-
way radio contact with any of the participating military radio stations. Those who
receive and accurately copy the Armed Forces Day CW and/or RTTY message from

the Secretary of Defense will receive a special commemorative certificate.
Crossband Radio Contacts--The military-to-amateur crossband operations will
be conducted from 1300Z May 21 until 1300Z May 22. Military stations will transmit
on military frequencies and will announce the specific amateur band frequencies being
monitored. Limit contacts to three minutes. The following stations will transmit on the
designated frequencies (in kHz): AAE, Fort Sam Houston, TX: LSB--4030.5; USB--
13994.5 27992.5; CW--20941.5 RTTY/LSB--7358.5. AAH, Fort Lewis, WA:
SSB/CW/RTTY--4021.5 6988 7312.5; USB--14488.5 18212.5 20975. AAR, Fort
Bragg, NC: LSB--4033.5; RTTY/CW--7309.5; LSB/CW/RTTY--6911.5; USB--14440
20105.5 27810. AAZ, Fort Huachuca, AZ: LSB--4.36.5 7422.5; CW--6908 21825.5;

USB--13965 27790. AIR, Andrews AFB, MD: LSB--4025 7315; USB--14408; RTTY-
- 13986.5; CW--6995.5 12997.5. WAR, Fort Detrick, MD: LSB--4018.5; CW--
6998.5 13992.5; SSB/CW/RTTY--7361.5; USB--14403.5 20995.5. NAM, Norfolk,
VA: LSB/RTTY/CW--4005 7393 10255. NAV, Cheltenham, MD: SSB/RTTY/CW--
4040 7365; CW/RTTY--10259.5; USB--14393. NAV-8, Honnolulu, HI:
SSB/CW/RTTY--7301.5 14820. NBL, Groton, CT: SSB/RTTY/CW--6835 14385
20375. NMH, Alexandria, VA: SSB/CW/RTTY 4015 7346.5 14468.5. NMN,
Chesapeake, VA: SSB/RTTY/CW--6970 13975.5 24783.5. NPG, Twenty-nine Palms,
CA: SSB/RTTY/CW--4008.5 14465 20937.5. NPL, San Diego, CA: SSB/RTTY/CW-
-7382.5 14385 20625. NZJ, El Toro, CA: SSB/RTTY/CW--7375 14480 24805
Receiving Test--The CW and the RTTY broadcasts will be special Armed Forces Day messages from the Secretary of Defense to any Amateur Radio operator or
SWL desiring to participate. A 10 minute tuning call will precede each transmission.
The CW broadcast will be transmitted at 25 WPM beginning at 0240Z May 22. It will

be transmitted by the following stations on the listed frequencies (in kHz): AAE, Fort
Sam Houston, TX--7358.5 20941.5; AAH, Fort Lewis, WA--6988 10151.5 14488.5 18212.5; AAR, Fort Bragg, NC--7309; AIR, Andrews AFB, MD--6995.5 12997.5; WAR, Fort Detrick, MD--6998.5 13992.5; NAM, Norfolk, VA--7393; NAV, Cheltenham, MD--10259.5; NAV-8, Honolulu, HI--14820; NBL, Groton, CT--14385;

NMH, Alexandria, VA--7346.5; NMN, Chesapeake, VA-- 6970; NZJ, El Toro, CA--14480; NPG, Twenty-Nine Palms, CA--20937.5. Three RTTY broadcasts will be transmitted. The first will begin at 0330Z May 22 and transmitted at 100 WPM Baudot
using 170-Hz shift. The second will begin at 0430Z and will be transmitted via packet,
and the third via AMTOR (FEC mode) at 0530Z. They will be transmitted by the

following stations on the listed frequencies: AAE, Fort Sam Houston, TX--7358.5;
AAH, Fort Lewis, WA--6988 10151.5 14488.5 18212.5; AAR, Fort Bragg, NC--7309.5; AIR, Andrews AFB, MD--13986.5; WAR, Fort Detrick, MD-- 13992.5.
NAV, Cheltenham, MD--10259.5; NAM, Norfolk, VA--7393; NAV-8, Honolulu, HI--14820; NBL, Groton, CT--14385; NMH, Alexandria, VA--7346.5; NMN, Chesapeake, VA--6970;
Submission of Test Entries--Transcriptions of the CW and/or RTTY Receiving
Tests should be submitted "as received". No attempt should be made to correct possible
transmission errors. The time, frequency and call sign of the military station copied as
well as the name, call sign and address of the individual submitting the entry must be
indicated on the page containing the test message. Entries must be postmarked no later
than May 26 and submitted to the respective military command as follows: AIR to
USAF MARS Armed Forces Day Celebration, 89CG/SCOJM Alabama Ave STE 3, Andrews AFB, Washington, DC 20331-6345; AAE, AAH AAR, or WAR to Armed Forces Day Test, Commander, USAISC; ATTN: ASOP-HF; Fort Huachuca, AZ 85613-5000; NAM, NAV, NMH, NMN, NPG, NPL, NZJ, NAV-8 or NBL to Armed Forces Day Celebration, HQ Navy-Marine Corps MARS, Bldg 13 9190 Commo Rd, NCD Cheltenham, Washington, DC 20397-5161.

NOTE: The Effective Sunspot Number for 16 MAY 94 was 29.4.
The Full Kp Indices for 16 MAY 94 are: 4o 4+ 5- 4o 6- 4- 3+ 3-
The 3-Hr Ap Indices for 16 MAY 94 are: 28 32 42 28 62 24 19 14
Greater than 2 MeV Electron Fluence for 17 MAY is: 8.6E+08

SYNOPSIS OF ACTIVITY

Solar activity was very low. Newly assigned Region 7727
(N08E67) joined the three other visible spotted regions. Region
7722 (N08W01) is easily the most interesting region, but it has
been quiet.

Solar activity forecast: solar activity is expected to be
very low to low.

The geomagnetic field varied from quiet to active levels the
past 24 hours. Greater than 2 MeV electron fluxes ranged from

normal to high levels.

Geophysical activity forecast: the geomagnetic field is
expected to be predominantly unsettled. Episodes of active
to minor storm levels may occur during local nighttimes.

Event probabilities 18 may-20 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 18 may-20 may

A. Middle Latitudes
Active 50/25/25
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/25
Minor Storm 25/20/10
Major-Severe Storm 10/10/05

HF propagation conditions continued near-normal to
slightly below-normal over all regions today. Occassional
minor signal degradation continued to affect the high and polar
latitude paths. Similar conditions are expected, although the
gradual improving trend will continue over the next 3 days.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

>frequency. I'm not sure what he used as a detector, but it did work.

Loomis took advantage of the roughly 300 volts/meter potential in the atmosphere to activate his transmitter. The current flow is small, except during thunderstorms, but it was sufficient to generate a detectable signal at a distance in the days before widespread use of electricity.

Nathan B. Stubblefield's work was much further advanced. He sent *voice* signals over distances greater than 30 miles before Marconi et al sent spark signals. His system was powered by batteries and apparently worked on the principle of sheet conductance. (He was very secretive about the exact details.) He conducted a demonstration for Congress where he communicated by voice with a ship in the Potomac from the shore. His was the first "underground" radio station.

And of course there was Tesla. He had radio controlled boats operating in the lake of Central Park in one demonstration well before Marconi generated his first sparks. Tesla was fasinated by resonance phenomina.

>is still very current and functional - and cheap, AND you can work
>around the world with it. When did that cease to be the driving
>force in amateur radio? Two meters IS all that's left :-(

VHF/UHF is in general much more useful and much more popular than HF for genuine communications. Older equipment is very much available, servicable, and cheap, but newer equipment does tend to attract many buyers. Because VHF/UHF *is* so much more popular than HF, there is a much wider variety of new equipment from which to choose.

If budget is a consideration, however, I just bought a VHF 90 watt transportable rig at Dayton for $8. It works too! It's a GE Master Exec in a GE transport case with a TPL amp and marine battery. Just add an antenna and you're in business. Or, if you must buy Japanese, I saw dozens of IC2s for sale for under $100. That's a perfectly servicable belt rig, better than many current models.

What's the point of "working around the world" if you don't have anything interesting to *say* to the other operator? Just exchanging meaningless signal reports isn't interesting. It has been done to death already by others. On VHF/UHF you're much more likely to establish long term friendships with other operators, and to engage them in interesting conversations on a near daily basis. That's rather rare on HF, except on 75 meters, and that's such a zoo of noise and interference that the contacts are rarely pleasant.

2282. What does HAM mean ?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-18 06:17:03 UTC
From: srogers@uqac.uquebec.ca
Message-ID: <CpzIsG.20G@uqac.uquebec.ca>
Source record: 266752

This is a newbie question.

I'm sure the answer is obvious for most of you knowledgeable people, but seems I looked everwhere -- dictionaries, magazines, books -- with no luck.

What does HAM stand for?

Wild guesses:
==========

- Healthy AMateur enthousiasts ?
- Home (to the) AM band ?
- Hail (to the) Almighty Meter (bands) ?
- Hang (in) And Monitor ?
- How (to) Air (your) Mouthpiece ?

What ?

Thanx for any help. Oh... and of course there's DXing... Ah !... new hobbies, new vocabularies... To DX is to....

Susan

That argument doesn't wash. Kilocycle is MORE descriptive than kilohertz -- the first tells you HALF of what the unit is, while the second tells you nothing unless you already know what a "hertz" is defined as.

The fact is that kc and Mc were just as well understood without the "/s" as kHz and MHz are now.

2290. Digital Delay Circuit Ideas?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-18 13:31:51 UTC
From: jra@lawdept.daytonOH.ncr.com
Message-ID: <jra.126.00088822@lawdept.daytonOH.ncr.com>
Source record: 266737
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc

I'm designing a clock to be driven by my local frequency standard. My goal is to be able to set the second mark to better than 1 millisecond (and I hope eventually much better than that).

To do this, I need to build a variable delay that I can use to slew the seconds marker. Actually, I'll need a couple of delays, starting at a higher frequency for fine adjustment, and finally running at a lower one for course adjust. Obviously, for stability reasons I want to do this digitally and not with some sort of analog delay.

Any suggestions on CMOS devices (probably a presettable counter?) that would work well here? The larger the count range in a single chip, the better.

Thanks...

>| "No one NEEDS the HF frequencies, especially for some dumb ..hobby..
>Like all analogies, yours has a weakness: were HF frequencies designed
>to kill people?
>Dave Horsfall (VK2KFU)

given the technophobic luddites and chicken littles that seem to pervade society today, you can probably find more than a few people that are willing to subscribe to the idea that they are being killed by incidental RF energy exposure.

one local case, has people that moved next to Patrick AFB raising cain over the Air Traffic Control radar and the military radars there causing them to suffer diseases because they know they're being exposed since they can hear the buzz on the radio....and it's not like they just plopped those down on the base last month.....

we also have the folks upset over the new doppler radars being installed by the US NWS - montel williams had a show that sensationalized the "dangers of the NEXRAD systems" - improved severe weather detection notwithstanding.

they don't want to be exposed to radio waves AT ALL! of course natural radio is OK because it's a natural occurance rather than a synthetic man-made radio wave. (same logic that says a chlorine atom comes in 2 flavors - "organic" and "ionic"...jeez some folks need to take high school chem for the first time..)

a defense is to show that even if there is an effect, it's potential is small compared to the greater good of being able to call for the fire department or police that can more quickly respond due to radio dispatching....especially when they arrive on a scene and determine they either need more or less help and can notify the other units directly....

this can be extended to personal communications like cell radiophones and such.

Actually your argument doesn't wash either. Everything we do has labels assigned to it and we use those labels to understand the concept. This is a "plebian" version of Plato's "world of the ideas". Cycle has no more meaning by itself than Hertz does. What is an Ohm! An ampere! An Henry!
Etc! We know what these things are because we learn what their definitions in
the physical world are. Hertz is a unit like Ohm or Watt and it has its definition. This definition more exactly defines the principles than an incorrect usage of another definition.

If someone can't learn a definition as basic as Hertz perhaps they ought to get a different hobby.

Message-ID: <199405181510.IAA01305@ucsd.edu>
Source record: 266837

Loomis' experiments were actually rather well documented, given the almost pseudo-science style of these early attempts at wireless communications. Loomis received a patent for his system, and tried to raise money to implement a commercial wireless network. His New York backers were wiped out in one of the frequent financial "panics" of the 19th century.

His patent was #129,971

His experiments were mentioned in Scientific American, Feb. 16, 1878; Feb. 15, 1879; and Feb 22, 1879.

He died in 1886.

Our Field Day group operates from a site about 1/2 mile from the site Loomis used in the late 1860s and early 1870s (We're on the same ridge, one `peak' (or what passes for a peak in the Blue Ridge) south of his site).

Having nothing else to do but ponder things that make you go "hmmm", I thought I'd pose this question to the net:

You know when people put code in their postings, like this:

·_·· ___ ··· · ·_·

Since the net has so much bandwidth, I think they should use FSK, like this:

_-__ --- ___ _ _-_

Where a dit is "_" and dah is "-" and it's easier to type; you merely toggle the shift key to go between a dit and dah. As an alternative, they could even convert it to ASCII -- that is, instead of "._" they could type "A", etc.

Opinions?

Hertz is equally descriptive as all other derived units used like Ohm, Watt,
Farad, and Henry. Cycles was eliminated a long time ago since it was
fundamentally wrong (it described something else.) That the unstated
'per second' was understood is due no more consideration than Hertz is
understood to be cycles per second. After all, if you 'just gotta know,'
you might as well 'just gotta know' the correct thing.

Interesting concept. You condone jamming jammers then? I thought that
type of mentality was limited to 27mhz.

Then again, 27mhz, 144mhz... Its all the same today.

: with other operators, and to engage them in interesting conversations on
: a near daily basis. That's rather rare on HF, except on 75 meters, and
: that's such a zoo of noise and interference that the contacts are rarely
: pleasant.

I do agree that VHF/UHF is a good way to get on the air and make friends. But the same can also be true on HF. I've been addicted to contesting and DXing for many years. I've made tens of thousands of quick signal report contacts on HF. I have made many friends in the local area who have the same interest. The friendships often go way beyond just a mutual interest in ham radio. Also made many friends all over the country (and world to a lesser extent) that share the same interests. If I am traveling around the country these ops generally will take me out to dinner, show me the town, etc and often offer me a place to stay.

In 1984 I had a quickie contest QSO with a station in Guyana. I sent for a QSL card and also asked about getting a license to operate in Guyana (it was very hard to get on from 8R at that time). I ended up visiting Guyana that year during the CQWW SSB DX Contest. This gentleman found me a house to rent where I could put up antennas, helped me through a pile of red tape to get a license and get my equipment through customs (took four days). He met my plane and returned me to the airport and invited me over for several meals with his family. The first weekend I was there the Boy Scouts were having their ham radio weekend. I helped the scouts get a station set up, designed and installed the antennas and got the kids on the air. Granted this is an extreme case, but all this resulted from one 15 second contest QSO with a gentleman who believed in the fraternal aspect of ham radio.

By all means get on VHF/UHF and enjoy but don't forget about HF. After all the years I've been on the air I still get a kick just from just making contacts around the country or around the world (whether they are short or long contacts). Despite all the negative things presented here in this group there are a lot of good people on HF and a hell of a lot of fun to be had.

On Saturday May 21'st we will have a special guest on Spectrum. Cliff Stoll K7TA the author of 'The Cuckoos Egg'. We will talk about the internet and his extremely interesting views on the communications world as we enter the 21'st century. We will in addition get a guided tour through the internet from one of the worlds leading experts. We'll also take a look at computer security. So join us for a digital Spectrum from the high-tech edge.

On May 28'th we will interview Larry Ledlow NA5E. Larry has just returned from an assignment with the UN in Croatia and Bosnia. He will clue us in on the communications scene in that troubled part of the world.

On Saturday June 4'th we will take a look at Digital Audio Broadcasting or DAB. This high-tech system of broadcasting is in the wings and should be here near the end of the century. A few systems have been proposed for dab and a standard hasn't been decided as of yet. Our guest will be Ted Schober. Ted has been on the leading edge in the world of DAB and will give us a look into the radio of the future.
--
Spectrum airs live Sunday at 0200 UTC (2200 EDT Saturday) on:

WWCR, 5810 KHz, Nashville, TN (World Wide)
WIFI, 1460 AM, Florance, NJ (Philadelphia Area)
KHNC, 1360 AM, Johnstown, CO (Denver Area)
Omega Radio Network, Galaxy III, X17, 5.8 MHz WIDE audio. (Satellite)

Spectrum is rebroadcast:

Sunday at 1500 EDT, on WIFI, 1460 AM, Florance, NJ (Philadelphia Area)

: What does HAM stand for? Susan srogers@uqac.uquebec.ca

Hi Susan, I've been a ham for over 40 years and my Elmer told me back in the early '50s that the term originated with English hams. The English term for ham originated long before amateur radio and was generally applied to a person who was an amateur at anything, e.g. ham actors. In my opinion, it probably originated in antiquity as a shortening of the cockney way of pronouncing amateur (Hamateur). You will hear a lot of other explainations but this one seems the most likely to me.

>in use" situation discussed elsewhere.

Ed, go eat a few prunes. If Radio Bangkok with their 25 kW xmtr is on
7110 kc and I use 7109 with 2 watts I think that's efficient use of
the spectrum; Thailand's listening audience is not being bothered
and the ham I'm in QSO with can save power since his BFO is turned
off ;) (and he get news and music at the same time as the QSO!).
A 1kc CW beat note is comfortable to listen to.

>one else agree or disagree with me on this?

Yes, I pretty much do agree. Like a lot of other pastimes, ham
radio has it's fair share of mouthy, obnoxious, self-centered jerks,
but on balance I'd say that your percentage is close to correct. It
just happens that because hams can get on the air and broadcast their
obnoxiousness to the world, they stick out more than the millions of
good guys and gals; and occasionally, an otherwise good-person ham
gets suckered into "striking back" and so we think there is one more
jerk than there really is, so *don't* do it, folks. No matter how
tempting it is to give them a piece of your mind , don't; that's what
they're looking for, anyway. Poor, insecure, unfulfilled clods who
are engaged in a search for recognition.....after 37 years in this
hobby, it still amazes me that so few can be so stupid for so long...
and get so much undeserved attention in the process.

Dick-

I started with a Coleman generator, which had a good reputation for quality. However, the noise was so loud, my neighbors got mad at me when I ran it! It's a good thing I bought it at a store that guaranteed satisfaction.

After that experience, I found a Honda dealer who was able to demonstrate several models. Of all I've heard, the Hondas were the quietest, as well as being the most expensive.

I ended up getting the 1000 watt portable Honda unit. It can probably handle several rigs at field day. It is about 10 dB more quiet than a lawn mower, and can easily be carried by one person. I found a small 10" McCullough chain saw that it would drive, and it will work with most electric hedge trimmers.

If you're really "power hungry", as I was when I got started, there are several higher power Honda models. You may need a truck to carry them around, though. It may take two people to lift the larger units, so you will find fewer uses for them between field days.

2317. cycles, cycles/sec vs Hz

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-18 22:24:23 UTC
From: oo7@astro.as.utexas.edu
Message-ID: <2re4in$6sm@geraldo.cc.utexas.edu>
Source record: 266764

If you guys are going to worry about kilocycles vs kilocycles/sec
you might also want to worry about the frequent use of milliHertz,
as in "144 mHz", "27 mHz", these low frequencies are not usually
what is meant - 1 mHz is 1 cycle per 15 minutes.

You might also wonder why we usually refer to the ham bands by
their wavelengths, but 160, 80 and 40m are the "low bands".
If you are on 20m, do you tell someone you are going up to 80m,
or down to 80m?

I suppose we should be happy if there is nothing more serious
to worry about in the hobby.

That's bull! I was going to stay out of this one, but logic like that
really irks me. The man below says it all. KILOCYCLE is far more
descriptive than KILOHERTZ. To me, KILOHERTZ means 1000 copies of a
man named Hertzian. Have you EVER seen a hertz on a scope? Not in this
lifetime. I've seen CYCLES on a scope for several decades.

>That argument doesn't wash. Kilocycle is MORE descriptive than kilohertz

2319. Re strange 154.46 xmtns

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-18 22:53:42 UTC
From: pmarsh@metro.mccneb.EDU
Message-ID: <9405182253.AA11441@metro.mccneb.edu>
Source record: 266647

David Checkett WG0Y asks about automated/computerized
transmissions on 154.46 MHz.

Karl Beckman WA8NVW replies that the freq 154.46375 is
allocated primarily for electric utility one-way
communications for load control.

My FCC 90.63 suggests that 154.45625 MHz is also a likely prospect.

BOTH freqs are shared with Local Govt, Petroleum, Forest Products, Special
Industrial, Business and Manufacturer Radio Services, so power companies
are not necessarily the only source of this traffic. I suspect that Karl
is on target with the most likely user. 154.46375 can be used up to 300w,
154.45625 is limited to 20 watts fixed, or 2 watts mobile.

>Henry!

WRONG! You chose a very poor word to pick on. Look up CYCLE. It means
to change back and forth. Hmm...funny how that describes what a size
wave (or other waveform having frequency content) does.

I would agree with the other words you brought up, except that they
describe something that doesn't already have a definition, unlike
cycles per second.

>If someone can't learn a definition as basic as Hertz perhaps they ought
>to get a different hobby.

Someone already covered that one quite eloquently.

JE>that 99% of the hams would be great and 1% would be idiots. I haven't been
JE>disapointed! 8-) In fact I was pleasantly surprised to find that it was more
JE>on the order of a .01% idiot factor. Is Amateur Radio a perfect world? No,

I agree with you totally. There are so many frequencies there to use
that it is very easy to bypass that .01% I have to date enjoyed all of
my digital contacts on HF. All have been pleasent. Everyone has tried
to be helpful in getting me into the ham hobby. With help in the tnc
problems I have had to explaining the stupid questions I have had as a
newbee ham, such as 'what is an antenna tuner do?'.

The worst I have heard is a couple of times on SSB phone, a few
people getting riled up when , due to propogation conditions improving,
two qso's start to cross over each other. Each group swearing they
owned the freq first and nobody wanting to budge. It was interesting to
listen to, and then I turned the dial.

I have only had my ticket since January of this year and I sure do enjoy
it. What a great hobby, I hope I enjoy it forever.

It would appear that you already have a different hobby-- argumentation,
however trivial.

2324. Ramblings about NiCd Batteries (LONG - 26K Bytes)

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-18 23:29:48 UTC
From: kennish@kabuki.EECS.Berkeley.EDU
Message-ID: <2re8dc$rmg@agate.berkeley.edu>
Source record: 266766

Greetings:

I have decided to write this diatribe due to the continuing Ni-Cd
battery saga. Yes, batteries are LOW tech -- they can't compare
to the bells and whistles of our latest HTs, but... your new HT is but
a paperweight (albeit an expensive one) without power from your batteries.
This is not a response to any particular prior post, and is unsolicited,
so in short, I'm not flaming anyone.... But, I thought it may be useful,
so, without further ado, let us take a more careful look into
NiCd battery management.

-Ken

P.S.:

1) The stuff below glosses over some of the more technical nitty gritty
details. I wanted it to be shorter than 50K Bytes!

2) I actively solicit corrections, both technical and editorial. If
you have information contrary to that presented below, please let me know.
Flames, on the other hand, are summarily disregarded, as usual.

Some Ramblings About NiCd Batteries
Ken A. Nishimura (KO6AF)

Credo #1: Charge control is the key to battery management.

More batteries are destroyed or damaged by bad charging techniques than
all other causes combined. Once a battery reaches full charge, the charging
current has to go somewhere -- most often, generating heat and gases.
Both are bad for batteries.

Q: How does a Ni-Cd battery work?

A: Let us answer this with another question. How does a electrochemical
cell work?

First, a bit of nomenclature. A cell is a single electrochemical device
with a single anode and a single cathode. A battery is a collection
of cells, usually connected in series to obtain a higher terminal
voltage.

Batteries, whether they are primary (use once) or secondary (rechargeable)
are devices which convert chemical energy into electrical energy. In the
case of the latter, they can take electrical energy and store it as chemical
energy for later use.

The key to electrochemistry are the processes of oxidation and reduction.
Remember the phrase" "LEO (the lion) goes GER (grr??)" -- Lose Electrons
Oxidation -- Gain Electrons Reduction. When one oxidizes a material,
it gives up electrons it becomes more positively charged, or
enters a higher oxidation state. Likewise, when one reduces a material,
one is adding electrons to it and either making it negatively charged
or reducing its oxidation state.

Now, one can make a cell using two materials, say A and B and immersing
them in a solution which can conduct ions, called an electrolyte. (An
ion is a charged atom or radical of a molecule capable of transferring
electrical charge). Now, let us say that material A is easily oxidized --
it likes to lose electrons, while B is a material that likes to
be reduced. When these two materials are immersed in an electrolyte,
and a circuit is completed from A to B, A is oxidized and electrons
are released to flow to the circuit. After performing electrical work,
the electrons flow into B, where B is reduced. The circuit from B to
A is completed by the flow of ions in the electrolyte. A secondary
cell can be reversed by forcing electrons into A, and reducing the oxidized
A to regain unoxidized A for use again.

This, of course, is an oversimplified view, as only certain combinations
of materials and electrolytes provides useful and practical batteries.

Oh, one more bit of nomenclature: The cathode is where reduction takes place,
and the anode is where oxidation takes place. So, in a battery which
is producing current, the positive terminal is the cathode, and the negative
terminal is the anode. Yes, this is counterintuitive from our understanding
of diodes, where the cathode is negative with respect to the anode...

Now, the NiCd system itself:

When the cell is fully charged:

The cathode is composed of Nickelic Hydroxide.

Now, nickel is one of those elements that has multiple oxidation states --
it can lose a different number of electrons per atom, depending on how hard
it is coerced. Nickel is usually found with oxidation states of 0
(free metal), +2, +3 and +4. The +2 state is referred with a -ous suffix,
while the +3 and +4 states are referred with a -ic suffix.
So, nickelic hydroxide is really NiOOH (the nickel has a charge of +3) or
Ni(OH) (the nickel has a charge of +4)
4

The anode is composed of free cadmium metal (zero oxidation).

The electrolyte is usually a solution of potassium hydroxide (KOH).

When one connects a load to the cell, as explained earlier, the anode is
oxidized and the cathode is reduced. Electrons leave the anode where
the cadmium is oxidized and forms Cd(OH) , plus 2 free electrons.
2
These two electrons go to the cathode where they reduce the nickelIC

hydroxide to form nickelOUS hydroxide or Ni(OH) (where the nickel has
2
a charge of +2)

This reaction can take place until the materials are exhausted. In theory, cells are manufactured so that both anode and cathode are spent at roughly equal rates.

Q: OK, so what happens when cells are charged?

A: Well, in a nutshell, the inverse of the discharge. To charge, one is forcing current back into the cell (opposite of discharge current). Here, electrons are being taken out of the positive terminal, and forced into the negative terminal. This means that the material at the positive terminal is being oxidized (hence is now the anode -- confusing, eh?) and material at the negative terminal is being reduced (now the cathode).

In the NiCd system, the cadmium hydroxide is being reconverted into cadmium, and the nickelous hydroxide is being reconverted to nickelic hydroxide.

Note that the electrolyte in both charge and discharge is a means to move the hydroxyl (OH-) ions around. Unlike the lead-acid system, the electrolyte really doesn't change in composition too much between the charged and discharged state.

Q: OK, so what's so tricky?

A: The easy part of charging is reconverting the spent material on the plates to the charged condition. The hard part is knowing when to stop. Let us take a moment to think about what happens when we overcharge the battery. Once all the nickelous hydroxide is converted into nickelic hydroxide, and in theory all the cadmium hydroxide is converted into cadmium, the charging current has to go somewhere. As the energy of the charging current cannot go into more chemical energy, it goes into splitting water (water is still the major constituent of the electrolyte). Just like the age old chemistry experiment of splitting water into hydrogen and oxygen, a fully charged NiCd cell does the same thing. You are forcing oxidation at the positive terminal and reduction at the negative. When one oxidizes water (actually the OH-) ion, one produces oxygen. Likewise, at the negative terminal (now the cathode), one produces hydrogen.

This of course is bad. Oxygen + hydrogen = BOOM. Cell manufacturers, or at least their lawyers, frown on this from happening. So, they cheat. During manufacture, they deliberately oversize the negative plate, and they partially discharge it. That is, they put a fully charged positive plate, but put a slightly discharged, but bigger plate of cadmium in. The amount of free cadmium in the oversized plate is matched to discharge in step with the amount of nickelic hydroxide provided in the positive plate.

Now consider what happens as full charge is achieved. Oxidation of water starts at the anode, but since the cathode is oversized, and has

excess hydroxide, the current continues to produce cadmium metal instead of hydrogen. At the same time, the separator (the material used to prevent the plates from shorting) is designed to allow oxygen gas to diffuse through, from the positive to the negative plate. The free oxygen then oxidizes the cadmium metal to form more cadmium hydroxide to prevent hydrogen from being formed. Voila -- a safe battery.

Q: OK, so it looks like batteries are well protected. Now what?

A: Not so fast..... this scheme will work only as long as the overcharging current is limited to a value such that the rate of oxygen liberation at the anode is less than or equal to the rate of diffusion across the separator. If the overcharging current is too high, excess oxygen is produced at the anode, and since not enough oxygen can diffuse across to make up for the reduction at the cathode, the excess cadmium hydroxide is used up. Then, hydrogen is formed. This leads to a dangerous situation, due to both fire and overpressure. Cells are designed to vent when this condition occurs, releasing the excess hydrogen and oxygen to the air before really bad things happen. While this may keep one's cells from blowing up, it does damage them, since one is losing material from one's cell. As one loses water, it upsets the chemical balance inside the cell -- lose enough water, and it stops working.

Another problem is that the process of generating oxygen, and recombining it at the cathode generates heat. With a moderate amount of current, the cell temperature can rise considerably, to 50 or 60 degrees C. If after charging, the batteries are hot, then you have overcharged them -- slap yourself on your wrist...

Credo #2: Heat is the enemy of batteries.

A NiCd stored, used, or charged under high temperature conditions will die an early death. Heat causes the separator to weaken, the seals to weaken, and greatly accelerates changes in the plate material, some of which cause the dreaded memory effect.

So even though the cells may not vent, the heat by-product is wearing down the cells. Specifically, hydrolysis or degradation of the separator material, usually polyamide, is greatly accelerated at high temperatures. This leads to premature cell failure (see below).

Q: What are battery manufacturers doing to prevent damage from overcharging?

A: Quite a lot. The demand for rapid charging has lead to a great increase in overcharging abuse. Most all NiCd cells can be rapid charged. The trick is to stop charging when it is fully charged. The so called "rapid charge" type of cells just incorporate protection against overcharging at high currents. Most often, this is done with activated carbon inserted in the cell to promote the collection of oxygen and to deliver it to the cathode for recombination. By increasing the rate of oxygen transport, one is increasing the ability of the cell to resist venting. Note however, that heat is still generated.

The price one pays for this is reduced capacity. Everything takes space in the cell, and space for carbon means less space for active material. Also, there have been some indications that carbon can cause the cadmium metal to corrode, possibly leading to a shorter life.

Q: How about those high-temp batteries?

A: There are ways to make NiCd cells more resistant to the damaging effects of heat. Mainly, using polypropylene separators and changing the electrolyte to sodium hydroxide makes the cells more durable under high temperatures. However, the cost is higher, and the internal resistance is raised, making high current discharge more difficult. Unless one knows that cells will be used at high temperatures, don't bother -- learn to take care of the cells to avoid overheating them.

Q: What about those super-high capacity cells?

A: Yup, the manufacturers are in a numbers game. It used to be that AA cells were 450 mAh. Then came 500, then 600 mAh. Now, 700, 800 and even 900 mAh cells are available. Next year, Sanyo will introduce a 950 mAh cell. OK, so what's going on? Well, the highest capacity cells use foamy or spongy backing material for their plates. This allows packing more active material into the plates, but the cost is higher resistance. Recall that one of the great virtues of NiCds is their low internal resistance -- this allows large discharge currents for transmitting, for example.

So far, the highest capacity sintered plate (best for low resistance) cell I have seen is the Sanyo KR-800 cell, rated at 800 mAh.

The Panasonic 900 mAh cell is of the foam type, and may work for a specific application, but expect higher resistance. I also suspect (but am not sure) that the Millenium cells are also foam type. For most consumer applications, the internal resistance isn't an issue -- for high power transmitting (e.g. more than 1A of current), it can be a concern.

Q: Does the memory effect exist?

A: <Flame shields on> YES.

Just as everyone is running around and saying that the memory effect is a myth, here I am, saying that it is true. OK, so, why is this? First of all, the term memory effect is quite unscientific. People tend to attribute any failure of a NiCd to memory.

Let us define memory as the phenomenon where the discharge voltage for a given load is lower than it should be. This can give the appearance of a lowered capacity, while in reality, it is more accurate to term it voltage depression.

Memory is also hard to reproduce, which makes it hard to study. Originally, memory effect was seen in spacecraft batteries subjected to a repeated discharge/charge cycle that was a fixed percentage of total capacity (due to the earth's shadow). After many cycles, when called upon to provide the full capacity, the battery failed

to do so. Since we aren't in space, the above is not really relevant...

Let us look at various causes of "memory" or voltage depression.

Memory can be attributed to changes in the negative or cadmium
plate. Recall that charging involves converting Cd(0H) to Cd metal.
2
Ordinarily, and under moderate charging currents, the cadmium that
is deposited is microcrystalline (i.e. very small crystals). Now,
metallurgical thermodynamics states that grain boundaries (boundaries
between the crystals) are high energy regions, and given time, the
tendency of metals is for the grains to coalesce and form larger crystals.
This is bad for the battery since it makes the cadmium harder to dissolve
during high current discharge, and leads to high internal resistance and
voltage depression.

The trick to avoiding memory is avoiding forming large crystal
cadmium. Very slow charging is bad, as slow growth aids large
crystal growth (recall growing rock candy). High temperatures are
bad, since the nucleation and growth of crystals is exponentially
driven by temperature. The problem is that given time, one will
get growth of cadmium crystals, and thus, one needs to reform the material.
Partial cycling of the cells means that the material deep with the
plate never gets reformed. This leads to a growth of the crystals.
By a proper execution of a discharge/charge cycle, one destroys the large
crystal cadmium and replace it with a microcrystalline form best
for discharge.

This does NOT mean that one needs to cycle one's battery each time it
is used. This does more harm than good, and unless it is done on a per
cell basis, one risks reversing the cells and that really kills them.
Perhaps once in a while, use the pack until it is 90% discharged,
or to a cell voltage of 1.0V under light load. Here, about 95% of
the cells capacity is used, and for all intensive purposes, is
discharged. At this point, recharge it properly, and that's it.

The more common "memory effect" isn't memory at all, but voltage
depression caused by overcharging. Positive plate electrochemistry
is very complicated, but overcharging changes the crystal structure
of the nickelic hydroxide from beta-Nickelic Hydroxide to gamma-Nickelic
hydroxide. The electrochemical potential of the gamma form is
about 40 to 50 mV less than the beta form. This results in
a lower discharge voltage. In a six cell (7.2v) pack, this means
a loss of 300 mV. Trick? Don't overcharge. Leaving cells on a
trickle charger encourages formation of gamma nickelic hydroxide.
Expect the cells to discharge at a lower voltage.

Summary:

DON'T deliberately discharge the batteries to avoid memory
DO let the cells discharge to 1.0V/cell on occasion through normal use.
DON'T leave the cells on trickle charge for long times, unless

voltage depression can be tolerated.
DO protect the cells from high temperature both in charging and storage.
DON'T overcharge the cells. Use a good charging technique.
DO choose cells wisely. Sponge/foam plates will not tolerate high
charge/discharge currents as well as sintered plate.

Q: OK, so I need to "properly" charge cells. How do I do that?

A: There are many methods of charging. One is trickle or the old
15 hour method. This involves using a current of about 50 mA (for AA
cells) and leaving them on charge for 15 hours. At this current level,
oxygen diffusion is more than enough to take care of the excess current
once full charge is achieved. Of course, one runs the risk of voltage
depression due to overcharge.

The best method is the so called delta-V method. If one plots the
terminal voltage of the cell during a charge with a constant voltage,
it will continue to rise slowly as charging progresses. At the point
of full charge, the cell voltage will drop in a fairly short time.
The amount of drop is small, about 10 mV/cell, but is distinctive.
There are circuits out there built specifically to look for this.
The Maxim MAX712 and 713 ICs are ones that come to mind now. This
method is expensive and tedious, but gives good reproducible
results. There is a danger in this though. In a battery with
a bad cell this delta - V method may not work, and one may end up
destroying all the cells, so one needs to be careful. If one ends up
putting in more than double the charge capacity of the cell, then something
is wrong.

Another cheap way is to measure the cell temperature. The cell temperature
will rise steeply as full charge is reached. When the cell temperature
rises to 10 degrees C or so above ambient, stop charging, or go into
trickle mode.

Whatever method one chooses, a failsafe timer is a requirement with high
charge currents. Don't let more than double the cell capacity of
charge current flow, just in case. (i.e. for a 800 mAh cell, no more
than 1600 mAh of charge).

Q: I've seen terminology like "C/n" where n is a number. What gives?

A: This is a method of expressing current as a fraction of the Ah rating
of a cell. Simply, a 100 mA current means much more to a small N cell
than to a large D cell. So, rather than use absolute units of amperes,
cell manufacturers often use fractions of cell capacity, or C. A typical
good AA cell has a capacity of 700 mAh, so C = 700 mA. A current of
C/10 is therefore 70 mA, while C/2 is 350 mA.

Q: So, what's the right charge current?

A: Depends. If using an unregulated charger -- one that doesn't
do any detection of full charge, then one must restrict your charge
current to the overcharge capacity of your cell. All NiCd cells I have

seen can handle C/10 (approx. 50 mA for AA cell) indefinitely without venting. This is not to say that one won't get voltage depression, but rather that one won't destroy the cell(s).

If one wants to get a bit more aggressive, a C/3 charge will recharge the cells in about 4 hours, and at this rate, most cells will handle a bit of overcharge without too much trouble. That is, if one catches the cells within an hour of full charge, things should be OK. No overcharge is best of course.

Only with automatic means of full charge detection should one use charge currents above C/2. At this current level and above, many cells can be easily damaged by overcharging. Those that have oxygen absorbers may not vent, but will still get quite hot.

With a good charge control circuit, charge currents in excess of C have been used -- the problem here becomes reduced charge efficiency and internal heating from ohmic losses. Unless one is in a great hurry, avoid rates greater than C.

Q: You mentioned cell reversal. What is that, and why is it so bad?

A: In a battery, not all cells are created equal. One will be weaker than the others. So, as the battery is discharged, the weakest cell will use up all its active material. Now, as discharge continues, the current through the dead cell is becomes a charging current, except that it is reversed. So, now reduction is occurring at the positive terminal. As there is no more nickelic hydroxide, it reduces the water, and produces hydrogen. Cell pressure builds, and it vents. The cell has lost water and the life of the cell has been shortened

This is the big danger of battery cycling to prevent memory. Invariably, unless one is very careful, one ends up reversing a cell. It does much more harm than the cycling does good. Also, keep in mind that cells to have a finite life. Each cycle is a bit of life.

Credo #3: Take care of your cells, and they will take care of you.

I have a set of cells from 1981 that are still working. Sintered plate, 450 mAh old technology -- originally trickle charged, now rapid charged many times using a delta-V technique.

Q: OK, my cells died. I was nice to them, what happened?

A: All good things must come to an end. No matter how well one takes care of the cells, they will eventually die. There are two main reasons cells fail, other than abuse. One is separator failure, and the other is degradation of the active material. The first is far more common, and the result is a shorted cell. Every time a cell is charged, the active material is redeposited on the plates. Ideally, this occurs uniformly across the surface of the plate.

However, in reality, there will be bumps and valleys. When there are bumps on both the positive and negative plates are adjacent,

separated only by the separator, the resistance between those
two points is slightly less than in other regions of the cell.
So, the current density there rises. This means that more
material is deposited there, contributing to even more "bumpiness".
In reality, needles called dendrites form, and given time,
they can force themselves through the separator to short the cell.

A cell that appears to self-discharge in a couple of days has dendrite
problems, and will soon completely short out. Plan to replace the
cell.

Degradation of the active plate material is just a normal aging process
of cycling. Both of these mechanisms are very good reasons to avoid
cycling the cells after each use. Cells should live to about 1000 cycles
if treated properly. Anything over that is gravy.

Q: I've seen people talk about zapping cells to revive them

A: Yup -- a quick fix it. When cells short due to dendrites, the
piece of material that is actually shorting the cell is very thin.
So, by forcing a huge impulse of current into the cell, one can
vaporize the dendrite -- sort of blowing a fuse.

This works, and can revive an otherwise shorted cell. However, it is
a stopgap measure at best. First, the fact that one dendrite has formed
means that another is not too far behind. Second, the material that
was vaporized has now permeated the separator material, forming a
resistor that shorts the plates. The cell may no longer be shorted,
but will still have a poor charge retention.

Besides, unless done properly, this can be dangerous as large currents
are necessary.

Q: How about self-discharge?

A: Yes, NiCds have a bad habit of going dead when you just leave them.
Fortunately you can recharge them. The current cells discharge about
1 percent a day, maybe a bit less. Expect them to be mostly flat after
3 months. Unfortunately, the so called 15 hour trickle chargers more
than make up for self-discharge. In fact most of the current goes to
making oxygen, not making up for self-discharge. If you want to make
something to keep your cells from self-discharging, make a 1 to 2 mA current
source. That should more than overcome self-discharge.

Q: What about NiMH cells?

A: NiMH or nickel metal-hydride cells are a promising alternative
to NiCds. They use hydrides (metals capable of storing hydrogen) as
the negative material in lieu of cadmium. They have higher capacity
for the same size cell, and don't use toxic cadmium. They also are
advertised as not suffering from memory.

The downsides: They are expensive (all new technology is). They have
a horrible self-discharge rate (I have measured between 3 to 10 percent

per day -- useless after 1 month). They are trickier to charge. Delta V works, but the voltage drop is very small (2.5 mV/cell). Better to charge them to a point where the voltage stops rising. And, yes, the same thing goes with hydrides as with cadmium. They can suffer from memory, though it is much harder to see than in NiCds. Expect to see a bit less touting of the "memory free" operation of NiMH cells in the future.

Q: What if I want to learn even more about NiCds and other batteries?

A: There are several good texts on batteries. One is quite new and contains fairly contemporary material:

Maintenence-Free Batteries by D. Berndt, Research Studies Press, Ltd., Taunton, Somerset, England in conjunction with J. Wiley & Sons, New York, 1993. ISBN 0-86380-143-9.

Note: Panasonic, Sanyo, and Millenium are registered trademarks of their respective holders. This document is not intended to promote a particular manufacturer or product. Material contain herein is believed to be correct, but the author cannot be held responsible for error, either editorial or material contained within. For what it's worth, I recently bought an Eveready nicad charging station (about 15 or 20 bucks) that charges AA, AAA, C, and D in three hours. I've used it with my Radio Shack nicads, and they work fine with this system. (After the batteries are charged--three hours--the little red light goes out to indicate they are ready for use. I assume the charge is stopped or lowered when this happens?

Also--this unit charges 9-volt nicads too, but it takes a full 12 hours to get them up to 100%. Why the difference in 9V vs. everything else? Maybe because you're charging 6 cells vs. one cell?

Can't be FSK, I still see breaks in the carrier. More like SKSK, "Shift Key Shift Keying." To make this more like FSK we should send continuous carrier, i.e. "mark" between characters. Of course we have to add a start bit for synchronization. Since Morse isn't a constant length code, what would we do at the end of the characters? Do we need to do bit stuffing?

The FTP server at Buffalo has a postscript_610 file that contains code for printing out a Form 610 on a PostScript(r) printer. Has anyone successfully used this for submission to the FCC? Seems like it would be an easy way to have lots of 610s on hand -- if the FCC accepts it.

Hello Mark

There is usually good propagation between North America and VK/ZL from about 0600 UTC to about 1300 UTC on 7 MHz, with a peak occuring at about your sunrise, and perhaps a bit after (with radid QSB and sometimes flutter at this time). Myself and several other CW types hang out from about 7.001 to about 7.018 MHz, and also (less frequently) on the look-out for Generals above 7.025. I often reply to CQ's from N A above 7.025, but not so successfully (perhaps because a VK reply is not expected?). The CQ call from this side is sometimes "CQ NA" (North America).

Between the times mentioned above; you may hear VK3RP, VK6DX, VK3XU and several other VK's and ZL's.

Very similar propagation also on 10.1 MHz.

73 Drew, VK3XU.

2330. Fond memories of first QSOs?

Great story! That first QSO is always the greatest and one you always
remember.

Why don't we keep this thread going and post our memories of our first
QSO here?

I was a Tech plus at the time and some friends of mine and I had put up
a G5RV in my backyard earlier that summer (they charged me a steak dinner 8-).
And there it sat until October when a fellow ham that I met on the local
repeater, KI6LV, offered to come over and show me how to tune up my Swan 700.
I said yes and shortly there after he came over. He showed me how to tune
the finals by dipping the grid and peaking the plate or was it the other way
around? 8-) After he tuned it he spun the knobs and told me to do it now.
I gingerly touched touched them and very carefully tweaked them until the
power output looked right. I glanced over at him and he said "looks good to
me, why don't you call CQ and see what happens?" I called CQ and lo and
behold a ham from Texas came back to me. I exictedly told him this was my
first QSO. He congratulated me and we chatted a bit. I asked him if he would
QSL me and he said that he had only been on the air 2 weeks himself and had
no QSL cards. He said he would send me a postcard though if that would be
all right. I said yes! (It showed up two weeks later and is on my wall now).
We signed with each other and Craig, KI6LV, asked me if I wanted to try
tuning up the rig again. I said NO, I wanted to have some more contacts.
He smiled at me and said that would be fine with him. 8-) He is now one
of best friends but that first time I met him and that first QSO will
always be remembered.

Any one else got any stories?

73!

Yep and every year it's on a different table. 8-)

Our club has a terminal that wouldn't die, every auction (twice a year)
it is sold by someone and like a bad penny it always comes back. 8-)

Why don't you try Copper Electronics. They have a line of good Scanner antennas, mobile and base. Their phone number is 1-800-626-6343 and ask for a catalog. They have a base antenna starting at 14.99. Hope this helps!

>and want to put an antenna for my ht on it. Any
>suggestions??

I ride a linear (LWB w/ underseat handlebars). I suggest 3 things for
all bike mobilers:
1) use a 1/2 wave antenna (no ground needed)
2) use a headset (keeps both hands on handlebar
3) mount your ptt switch on the handlebars near your thumb
resting position.

happy biking (and don't forget your helmet)

I agree! If we all got off HF, the jerks would own the bands!

Ddepew
N4QIX

Better yet, let's simply give (V/U)HF radios to everyone and say "have a good time!" Or, better yet, simply cross-band CB and all the public safety, business band, and broadcast band stuff into the ham bands in addition to handing them out. Then we can all party!

NOT!

If we want peace on the bands, we must fight for it! Otherwise, give up the spectrum, and the IARU and the FCC will reallocate it to get the money they want so badly. It's our choice.

Fight for our rights and privileges or lose it all.

It's your call.

73,
Scott

Actually, only the USA has not yet adopted the system accepted worldwide as
the standard for DAB. (Mostly because of intense lobbying by commercial AM
and FM broadcasters who see it as new competition in an already competitive
market.)
Trials of DAB has already begun in the highly populated Windsor - Quebec City
corridor in Canada, and elsewhere around the world.

Good God! Can you imagine the code/no-code implications this would have? Maybe the Internet Corporation of America (TM) could establish code and no-code access. The higher your USENET code reading speed is, the more access to those more "desireable" newsgroups you could get. (It could also include testing in basic Internet rules and regulations and the higher classes would get more technical such as routers, etc.)

>
>I'm sure the answer is obvious for most of you knowledgeable people, but
>seems I looked everwhere -- dictionaries, magazines, books -- with no luck.
>
>What does HAM stand for?

There are several theories on the origin of the term ham as applied to amateur radio operators. Many hold that it was a term of derision from telegraph operators who called inept operators hams because supposedly their Morse sounded like it was sent with a ham on the key. There's support for this from the term "ham handed". There's also the old theater expression of scorn for "ham actors" who are clumsy, inept, and self important.

There is also the idea that HAM came from the initials of three early amateur operators who had a station before formal callsigns were introduced. Unfortunately this fails because the initials don't match.

The best theory I've heard is that there was a popular magazine at the beginnings of radio called Home Amateur Mechanic that published popular plans for radio receivers and transmitters. So people would say that they had one of those HAM radios.

NOTE: The Effective Sunspot Number for 17 MAY 94 was 29.4.
The Full Kp Indices for 17 MAY 94 are: 4- 4o 3o 3+ 2+ 3o 2+ 3o
The 3-Hr Ap Indices for 17 MAY 94 are: 21 26 15 19 10 15 9 15
Greater than 2 MeV Electron Fluence for 18 MAY is: 5.3E+08

SYNOPSIS OF ACTIVITY

Solar activity was very low. Very few flares of any size
were reported. Region 7722 (N08W14) continues to dominate an
otherwise dull disk.

Solar activity forecast: solar activity is expected to be
very low. Region 7722 may generate an isolated C-class flare
during the next three days.

The geomagnetic field has been at mostly unsettled to active
levels for the past 24 hours. The greater than 2 MeV electron

fluxes varied from normal to high levels.

Geophysical activity forecast: the geomagnetic field is
expected to be unsettled the next 48 hours. Quiet conditions
should prevail at middle latitudes on May 21.

Event probabilities 19 may-21 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 19 may-21 may

A. Middle Latitudes
Active 25/25/25
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/25
Minor Storm 25/20/10
Major-Severe Storm 10/10/05

HF propagation conditions were near-normal over all
regions today except the high and polar latitude regions where
near-normal to slightly below-normal conditions prevailed.
Similar, if not continuing gradual improvements, are expected
over the next 24 to 72 hours.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event

Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

>> : Then you need to put up a better antenna. The maritime net on 14300 kc
>> : has been around for at least 20 years handling traffic, WX and phone

Erich: I said the above not Roger.

>
>This 14300kc interests me. First, I guess the author really meant 14.3
>kc.

No, I meant 14300 kc - no one is down on 14.3 kc except maybe the US Navy.

>Also, I guess that kc was used because it is supposed
>to show a long term connection with radio.

Your supposition is incorrect. I had just finished writing a series of
articles to be published concerning the maritime calling/distress freq
of 500 kc. `kc' involves two fewer keystrokes than kHz (counting the
shift key). Although, when I got interested in radio kc and mc were
standard.

>However, kc was always
>incorrect as used because it was always supposed to be kc/s. A time
>unit has to be provided to give a proper frame of reference.

Then I guess wind velocity given in `knots' is also incorrect since
there in no time reference. But we all know that `knots' means
`nautical miles per hour', just like we all know `kc' implies
`kilocycles per second'. Except for Erich...

>This kind of identification with "the true antiquity" of radio by
>using quaint "older" terms.

The article I was writing dealt with the history of 500 kc, thus kHz
would have been inappropriate. And as I mentioned, I would rather just
use 2 keystrokes (kc) dozens of time in the article rather than 4
keystrokes (k<shift>Hz). I could pick on you since the above is not
a correct sentence, but I won't.

>Always reminds me of being in the Army and
>being trained by older NCOs who always talked about the good old days
>of the "brown shoe" army when "men were men" and everything was just
>a lot better.

As a matter of fact, when I was in Coast Guard Radioman school in 1976 all of our manuals still used kc and mc.

>I guess the Kc is supposed to show that the poster came
>from a time when "hams were ham" and modern changes didn't affect the
>hobby. Or maybe I'm just being too critical of a slip.

No matter what the period of time modern changes will affect some but not necessarily others. I build xmtrs on scrap pieces of wood, use wood screws for terminals, and get components from old TV sets (no ICs, just old-fashioned transistors). And I just made a `sideswiper' telegraph key (popular back in the 20s) from a hacksaw blade. I wind my coils on cardboard toilet-paper tubes. My rigs reflect simplicity. So does `kc' (fewer keystrokes).

Go eat a few of Ed's prunes, Erich.

The Invention of Radio is a very nationalistic thing. Most Western
countries have an Inventor of Radio:
USA Loomis, Stubblefield
Germany Hertz
Russia Popov
France Branly
Italy Marconi
Britain ... probably Marconi, since his mother was British and the
main funding for his develops which led to commercialization
came from the British navy (Admiralty).

BTW - years ago the Science Museum in London had an exhibit on the 100th
aniversary of Marconi's birth. Push a button and you'd hear a recording of
him dwedicating the first 'phone link to Australia. He spoke British English
without a trace of foreign accent.

The most important thing to know about European repeaters is that most, if not all, require a 1750 hz tone burst for access. Not surprisingly, most of the chatter around Munich will be in German. There were some English language repeaters near some of the major US or British bases but there are no such installations of any significance around Munich any longer (peace dividend).

The best source on reciprocal license data is the ARRL. The have info packages on many countries.

It's been 9 years since I moved back home from Germany but I am confident this info is still fairly accurate.

Have fun,

: So, I transmit but do not raise the repeater. I have to remember that this rpt
: requires PL tone, to turn the tone on manually before xmitting. Wouldn't be
: easier to automatically turn it on if the recalled memory requires a PL tone
: on xmit? Can the HT still do that? How?

When you set the PL tone, do it while you are not in the memory channels.
You must set it first before you save it as a channel memory. And make sure
you have it turned on while you do save it. I have done it myself and have
had no problems with it at all. Here is the way to do it:

1. Set your HT up to the frequency you want.
2. Remember to add the split setup of what the repeater uses.
3. Go into the menu section and stop on the PL tones (Rc and tx or tc)
4. Set the PL tones to what you need for the repeater.
5. When those are set, get out of the menu and turn on your T-Sql.
6. Set the memory channel that you want to put it under. (Actually this
should be first).
7. Do the M-WR command(writes to the memory).
8. Check this by switching over to the M-CH to make sure it is set
correctly.

This should be correct.

I have used my HTX-202 for over a year now, and I have not had many problems
with it at all. As a matter of fact, a friend of mine recently checked my HT
out on a spectrum anyalizer and found that it performs much better than many
of those other HT's.

Hope this helps you out.

Source record: 266848

How about a missed first?

I had not done _any_ overseas hf (having just done vhf/uhf and Field Day U.S. hf contacts). So, one weekend I actually put up what I thought would be a decent antenna (a borrowed vertical I wanted to compare to my then nearly worthless wire antenna). I started tuning around in the Novice 10M voice band and started hearing DX! Ok, now _everybody_ has worked 100's of JA's, but _I_ had NOT.

So, I start dropping in my call in response to the QRZ. It wasn't a busy day or anything, but there were plenty of folks who wanted to chat with the JA for a couple of minutes or so. I tried this for about 30 minutes, but the JA never came back to me. By now I'm wondering if my SB1400 has suddenly become rx only! Why wasn't I getting a contact?

About this time my wife (Amateur Extra-KI5EV, Dawn) comes in. When I explain my frustration she says "Let me try it!". Well, I figured she could get frustrated to match me, so I got up and gave her the microphone. At first QRZ she joins the frey: "This is Kilo India 5 Echo Victor". Boy, I thought, with that normal voice and using long phonetics she'll _never_ get through: must have been twenty other calls while she said all that!

The JA came back up as the chatter of responses died: "KI5EV, go ahead, where are you located?". I darn near flipped out! So my wife chats nicely for a couple of minutes, logs the QSO and hands me the mic as she gets up. As she's leaving she brightly observes that she doesn't think there's anything wrong with the radio. Thinking that I could kill her later, I just jumped back into throwing N5RCK into the QRZ pile.

Needless to say, that session died as the freq went south and I had to say sayanara to any hope of a JA contact that day.

Oh yes, I did get my first JA (and so first DX) the next day.

The color of the paper is important. It cannot be white - it must be the same color as the "official" Form 610.

Hello everyone:

I am a mexican ham who will be moving soon to San Francisco, CA. I
am interested in obtaining a reciprocal permit to operate in the US. I
already have an FCC Form 610A. In one of the questions, the US mailing
address is requested, however, I still don't have one, can I just put
San Francisco or should I use someone else's address in that city?

I also would like to know if the FCC postal address that I have
is still valid:

FCC
1270 Fairfield Road
Gettysburg, PA 17325/7245

Thank you in advance for any help.

|> WRONG! You chose a very poor word to pick on. Look up CYCLE. It means
|> to change back and forth. Hmm...funny how that describes what a size
|> wave (or other waveform having frequency content) does.

OK, so cycle does mean something. I for one am not disputing it. However, "cycle" and "Cycle per second" are *NOT* the same. By the same token, kc and kc/s are not the same. Since KHz=Kc/s by definition, then KHz and Kc must *NOT* be the samething. Therefore, saying Kc when you mean Kc/s is just plain *WRONG*, even if everyone understands what you mean.

This is exactly the same difference as between distance (miles) and speed (mph). I have never heard anyones say they are driving 55 miles when they mean 55 mph. Granted, miles is used more everyday than cycles, the meaning is the same, and some people *do* use cycles as a word and mean "cycles."

As usual, my most ready source of information is the net :-) Anyway, I am moving to Boston shortly, and I was wondering what to do with my callsign. I mainly operate 2m/70cm FM and packet, so all of my communications are (supposed to be) more or less local. I am aware of adding a /1 if I was visiting, but this is a permanent move... am I now stuck doing that forever until I change my callsign? I doubt they have any 1x3's left there and I would much rather keep this one for a while. (Good reason to upgrade to Advanced, I guess :-)

Also, any pointers to Boston-area ham radio or scanning related resources will be much appreciated. If it makes a difference, I'll be in Cambridge.

Thanks,

Sorry, but knots is defined as "nautical miles per hour" just as Hertz
is *defined* as "cycles per second." Kc may *imply* Kc/s, but it
certainly is *NOT* defined that way.

Fine. Reflect simplicity. However, if you want your speaking and
writing to reflect simplicity of understanding, namely by people who do
not know your conventions, you should use kc/s or KHz as they are what
you are actually trying to say. Saying what you mean is always a much
better policy than expecting others to figure it out for themselves.

>

Right. The author talks about having photocopied 610s on "goldenrod"
paper and having them accepted. But, the question remains. Has
anybody successfully used this PostScript(r) file for submission to
the FCC? I wouldn't want to submit something and then have it not
accepted because this wasn't an official form. There are some small
differences. For example, the font is not an exact match for the
official form. The OMB notation at the upper left is omitted.

Oh yes, since I've gotten a lot of mail asking, I got this by FTPing
to ftp.cs.buffalo.edu and snarfing the file from the /pub/ham-radio
directory.

I was looking for an HF rig at the time. My first choice was an old Swan 350, with the glowing tubes and everything. The guy was a minister, and was going to throw in this monster antenna tuner, phone patch, and a few other things. He wanted $275 for everything -but I was a bit leery of the tubes, seeing as how the radio was ALL TUBES...

So he let me borrow it ($275 is a lot for a 16 year old, especially in 1985) for a few days and play with it. I brought it over to Gene Mertz's house (W3OEP, one of the guys who gave me my Novice test), and we hooked it up to the 40 meter dipole. Tuned up the radio, went around 7.110, called CQ, and was answered by KB4SJD in Kentucky. I was shaking so badly that I was having trouble even copying the 5 wpm! But Gene was there to back me up...

After about a 15-minute QSO, we shut the radio down. Turning it back on, it wouldn't put any power out. Thinking we'd found the problem by exploration of the schematic and some simple test equipment, we went out and got a PA driver tube. It didn't do the trick. The owner was a bit upset, but realized it wasn't our fault, and that we hadn't done anything to hurt the radio.

So my first QSO was on a radio I used once, didn't buy, and never saw again. But I got a card out of it!

2361. HTX-202 problem - summary

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-19 14:32:32 UTC
From: proctor@news-reader.nist.gov
Message-ID: <940519093232@emerald.nist.gov>
Source record: 266854

Many thanks to all who replied! There were a few replies here on the newsgroup, and I received several more via direct email.

It would appear that the problem with the HTX-202 power saver causing the receiver to sleep through a transmission is fairly common. I don't know if ALL units have this problem, but every response I received said that their HTX-202 has this problem. It is, at least, a common problem.

One person indicated that he sent his back to RS to be checked, and it has not seemed to do it since then, but that he also has only used the power saver a few times since then.

One person said (roughly) "It came from RS, What did you expect? Quality?" His point is well taken! :-) I guess you can't make a silk ear out of a sow's purse!

Thanks again.

It has the particular advantage that the "_" representing dit is longer in
length than the "-" representing dah.

I just heard on the 14.226 DX net that all the 3y0pi cards had been sent out. This came from AA6BB/7 so it has to be taken as gospil since he is the qsl manager.

SO I should measure my output power in kilogram-meters-squared per
second-cubed? That's the definition of a Watt. Now I have to change
the labels on my inductors to Volt-seconds per ampere. I meant volt-seconds
per Coulomb-per-second. No, I mean (kilogram-meters-squared per second cubed)-
seconds per Coulomb per second, no (kg-m2/s3)s/6.24x10^18/s. I think I like
Henry better.

>
>Someone already covered that one quite eloquently.
>Gary

Yep. If you can't learn the basic definitions, try another hobby.

It all comes down to 'Do you wish to communicate?' If your answer is yes,
then learn the units.

You probably learned things like 'inch' and 'gallon'. Those are just words,
like 'Hertz', no meaning until defined.

Hertz, by definition, is more informative than 'cycles'. How do I know that
'cycles' has a little 'per second' implied? It could be 'cycles per fortnight'
or 'cycles per micro-second' where Hertz means ONLY 'cycles per second'.

2366. HT speaker-mike question

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-19 15:40:52 UTC
From: gsherwin@nyx10.cs.du.edu
Message-ID: <2rg1a4$oa2@nyx10.cs.du.edu>
Source record: 266863

Greetings --
I have an Alinco 580, and after a bit of use in the field as a volunteer
I finally discovered how invaluable a speaker-mike is. I don't go out on
calls frequently, but when I do a speaker-mike makes life so much easier.

To get to the point, I've borrowed a standard-issue Alinco speaker-mike and
a Radio Shack speaker-mike for testing. I found the quality/convenience
differences between the two not worth the price difference (the Radio Shack
one costs about half the price of the Alinco), but I am concerned about
possible impedance mismatches, etc. I don't know if anyone has info behind
these two, but any help in understanding the importances of purchasing
one speaker-mike over the other would be greatly appreciated -- especially
in the area of impedance matching between the Radio Shack speaker-mike and
my HT. The RS s-m has some specs (including the mike impedance is specified
as "low"!), and I'm having trouble finding Alinco specs on the jacks, etc.

Thanks in advance for your comments or opinions --

As opposed to "short dead dipoles"?????-----------------------^ :)

My first rig was a Heathkit HW-16. I built it but it didn't work. I had an "elmer" who was not a ham, but had been a radio operator in the Navy. He helped (translated: I watched while he worked) me get the thing working by locating a bad solder joint or several and a few other fixes. The light bulb I brought for a dummy load finally (no pun intended:) lit up.

This is where my memory gets fuzzy. My first contact was with WN4LUR in Tennessee on 40 CW (7175000000 mc to bring another thread into the fray, or is that to fray another thread :-). I don't remember much about the QSO itself except the butterflies and shaking that I experienced. I have a QSL for the contact. The callsign database says that WB4LUR is still licensed. I want to get in touch with him as the 25th anniversary of that QSO approaches. I was a 15 years old in June 1969 when I made my first contact.

I have 4 or 5 logbooks filled, too, but back then I listed every CQ and every call which went unanswered.

No, I'll do it for you!

The thing that turns my crank is when someone identifies themself
by giving their call and then they say "for I D ".

Of course! that's what their doing isn't it?

Why do they have to be redundant? I never heard this proceedure
used in the 60's. Is this something that was carried over from
the "Chicken Band" when they where required to use a call?
When ever I here some one do it I ask if they operated a CB
radio before they where a Ham and usually the answer is yes.

Hi Greg, Be sure to get a speaker mike that has a stereo connection on
the mike connection because if you don't, you'll run your battery down
pretty fast discharging it through a 100 ohm resistor. The stereo mike
plug is used on Alinco and Icoms to deliver power to their VOX headsets.
DO NOT BUY A SPEAKER MIKE FOR THE 580 THAT HAS A MONO PLUG ON THE MIKE!
I have the newer model MFJ-284 for my 580 and I am very happy with it.

ZCZC AE27
QST de W1AW
DX Bulletin 29 ARLD029
>From ARRL Headquarters
Newington CT May 19, 1994
To all radio amateurs

SB DX ARL ARLD029
ARLD029 DX news

The items in this week's bulletin are courtesy of Bob, WB2CJL, the OPDX Bulletin, the Yankee Clipper Contest Club PacketCluster network and Contest Corral from QST. Thanks.

CAMBODIA. XU0HW has recently been heard on 20 meters as well as the WARC bands. He is using a 12 element log periodic antenna and a Gap vertical.

CRETE. HA6NY will be active May 24 to 31 mainly with RTTY.

NORTHERN MARIANAS. AH0T will be by JA6VZB, and KH2GR/KH0 by JF6BCC. They will be active May 26 to 30 on all bands with CW, SSB and RTTY. Plans include operating in the CQ WPX CW contest. QSL their respective home call signs.

ASCENSION ISLAND. N6TJ will be operating May 20 through June 2 as ZD8Z. Will be active on all bands during the WPX contest and plans to concentrate on 160 meters. QSL via VE3HO.

NAURU. Ron, ZL1AMO, who was active as C21/ZL1AMO last week is expected to show up from Western Kiribati, T30. QSL via home call.

SAINT PIERRE AND MIQUELON ISLANDS. Dave, KA1NCN, will sign FP/KA1NCN July 19 through 25. He will operate CW, SSB and RTTY on 160 through 10 meters. QSL via AA1AS.

CORSICA. Dieter, DF4RD, plans to be doing some work 30 km north of Ajaccio, though his radio activities will be limited. Seven Italian operators will be active from May 19 to 23. They will operate CW and SSB on 160 through 10 meters, with special attention to the WARC and lower bands.

CHAD. F5OIJ/TT8 was heard on 21335 kHz around 1345z on May 13. The operator stated he would be there for the next 3 to 4 months and be

issued the call sign TT8PS. No documentation has been received for this operation.

HAWAII. A special operation from North Oahu using above average transmit and receive antennas is planned from 0200z May 21 to 1600z May 22. Listen for KH6U and KH6IRT on 1830 kHz, CW and SSB. KH6U needs only WV, AK, VT and RI for his WAS award. Help him out if you can.

CANADA. Canadian amateurs have been authorized to use the prefixes XK, XL, XO, and VG from May 28 to July 28 in commemoration of the 50th Anniversary of D Day.

WHAT ARE THESE X5 CALLS? X5 is an unofficial prefix being used by Serbian hams operating from within the borders of Bosnia and Croatia. These stations are not valid for DXCC purposes.

ARMED FORCES DAY. Though not necessarily DX, working a military station split, straddled across a band edge, is certainly rare. This years Armed Forces Day is the 45th running of this annual event. Information on QSOs and receiving tests is on page 135 of May QST. Special CW17/RTTY and packet bulletin ARLX017 contain some update info.

THIS WEEKEND ON THE RADIO. There is a little something for everyone this weekend. Check out one or more of these operating events.

The ARRL Spring Sprint on 50 MHz is from 2100z May 21 to 0300z May 22. Exchange grid square designators. Full information appears on page 120 of March QST.

The Michigan QSO Party, sponsored by the Oak Park ARC, is from 1800z May 21 to 0300z May 22, and 1100z May 22 to 0200z May 23. In this SSB and CW event, work stations once per band and mode. The exchange is signal report, QSO number and county for Michigan stations, or state/province/DXCC country for all others. For more information, see pages 114 and 115 in April QST.

The Spring NWQRP Sprint, sponsored by the North West QRP Club, runs from 1700 to 2100z May 21. In this CW only event, run 5 watts output or less, and work stations once per band. NWQRP Club members will exchange RST, state and NWQRP number. Non-members sent RST, state and power level. Details appear on page 114 of April QST.

MFJ 90's RC May QRP CW contest, sponsored by the MFJ 90's Radio Club, is from 0000z May 21 to 2400z May 22. MFJ 90's RC members exchange RST, state/province/DXCC country. Non-members send RST, state/province/DXCC country and power output. See page 114 of April QST.

> Great story! That first QSO is always the greatest and one you always

My first QSO was on 40CW BOOTLEG! I was running a Heath VF-1 to a single 6AG7 link coupled rig at about 7 watts, and was using the call of a defunct private school. The name was "Dudley" and pse QSL via General Delivery, San Bruno, Calif.

It was the thrill of a lifetime, what with a 10-week old kitten climbing up my pantsleg and being half bombed on the old man's beer. My heart was pounding with anticipation of the FCC inspector imminently appearing behind my back. I was something like 14 y/o at the time. The contact was with a local in town (call withheld, he still doesn't know!). After receiving my 'legit' license, I looked up our QSO in his log and recall getting a creepy feeling seeing my bootleg call in another ham's logbook, like viewing an moment in a previous life.

My first legitimate QSO? Geez, I don't remember it too well. Think it was with a W7 somewhere up north.

2374. Repost of IC-3220a problem

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-19 19:08:38 UTC
From: n4tii@kd4nc.uucp
Message-ID: <1994May19.190838.16533@kd4nc.uucp>
Source record: 266870

Hi gang....I got ZERO response last time I requested help so I am doing it again...

I have a friend who has an Icom IC-3220a dual band mobile. The rig has a problem in its 2 meter transmit side....some times it puts out full power and the s/rf meter swings to verify this....however, other times, the mic is keyed and the s/rf meter does not indicate forward power, yet the tx light is on. The rig puts out maybe a farthing of a watt....

On the 440 side, the radio operates correctly, and the 2 meter receive side is fine...

William, N4SZP, the owner of the rig reports the problem started shortly after a long hot day in Auburn, Al when the temperature in the truck got so hot, it blew out a window...

Question: could the heat built up inside the car destroy a componet on the radio?

Question 2: Is just the CPU screwing up, as the problem is intermittant... yet more times broke than correct...

Question 3: If it is the CPU, what is the procedure for resetting the CPU?

Thanks in advance for all your help!

(Gary Coffman, any ideas? You seem to be omniscient (grin).

John

This thread is pretty interesting; my column for the Antelope Valley Amateur Radio Club, in April, was about my first time on the air. I wasn't shaking on my first contact, but it was comical in retrospect; a QRP transmitter maybe getting 30mW out into a really cheesy dipole, and a Globe Patrol super-regen receiver. I worked one of my elmers maybe 10 miles away. He had trouble hearing my signal, I had no trouble picking his loud signal out of the dozens I could hear at once on the Globe Patrol :-)

2376. GB2RS News 22nd May 1994

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-19 20:19:23 UTC
From: dave@llondel.demon.co.uk
Message-ID: <769403963snx@llondel.demon.co.uk>
Source record: 266873
Cross-posted to: uk.radio.amateur,rec.radio.amateur.misc,rec.radio.info

Good morning. It's Sunday the 22nd of May and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

And we start this week's broadcast with the good news that at a recent meeting with the RSGB the Radiocommunications Agency (the RA) assured the Society that the amateur radio licence fees would not be increased during the next year. The last increase was made in April 1991.

Not such good news is that the Radiocommunications Agency has experienced a number of problems in recent months with unattended operation of amateur stations, and have asked us to publicise the following:

Quote:"ATV stations operating in the 1.3GHz band have been left running unattended on sites remote from the main station address, and have caused severe interference at distances of 30 - 40km away to air traffic control radars which are the primary users of this band. The Amateur Licence does not permit unattended operation of TV in this band (except where a Notice of Variation has been issued for a repeater, and these are subject to careful site clearance procedures). Operation outside of the terms of a licence is unlicensed use, and enforcement action (which could mean prosecution and/or revocation) can be expected in these cases. This is particularly so where a safety of life service, the security of which is the RIS's first priority, is at risk." End Quote.

The potential consequences of being unable to close down an unattended transmitter that is causing interference to such services are very serious. It is important that all amateurs behave in a responsible manner and adhere to the procedures in the licence for unattended operation.

The RA have also had to investigate interference from unattended operation of digital modes on 144/432MHz. The licence does not require notification to the local Radio Investigation Service (the RIS) for such operation under clause 2(4)c, but amateurs should perhaps give some thought as to how their station could be closed down in their absence if problems arise. It might be wise to inform the local RIS of such operation as a precaution. These matters are currently under discussion between the RSGB and the RA.

One of the many Special Event Stations commemorating the forthcoming anniversary of D-Day is already in operation. This is GB0FYO, which remembers the visit to Portland by King George the 6th and Sir Winston Churchill on the 25th of May 1944, in preparation for D-Day. This

station is operated by the Portland Amateur Club from the Portland Heights Hotel. A comprehensive list of special stations will appear in June's Radio Communication.

The HF Committee of the RSGB has a vacancy for a keen HF DXer. The committee, which is responsible to RSGB Council for all HF matters, meets approximately every two months in the London area. If you feel you can help, write, with brief details of any relevant experience, to the committee chairman, David Evans, G3OUF, P O Box 599, Hemel Hempstead, Herts, postcode HP3 0SR.

The June issue of Radio Communication will be posted out to members during the week commencing 23rd May.

A DXpedition to the Shiant Isles, which is south-east of the Isle of Lewis, is scheduled to take place from next Friday the 27th until Monday the 30th of May. The team comprises: GM3NIG, GM3UTQ, GM4FDM and GM4YMA. Operation will be on all bands 160 to 10m, mainly around IOTA and WAB frequencies using the callsign GB8SH. The primary mode will be SSB, but CW, AMTOR, Pactor and RTTY will be available on request. Shiant is IOTA EU 112 and WAB NG49.

We now give further items of HF DX news taken from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From East Malaysia, JS6BLS will sign JS6BLS/9M6 from Wednesday the 25th until Monday the 30th of May on all bands on CW and SSB and during the CQ WPX contest.

From Jordan, a multinational group will use the following callsigns; JY8's JH, IC, OX, VA, ZC and ED from Sunday the 29th of May until Monday the 27th of June. Operation is primarily to air 6m for the first time, but all the HF bands will be used.

From Belize, V31PA will be active from today for the next five months. During the weekends check the frequency 14.15MHz from 2030 to 2200 UTC.

And from Vanuatu, P29VH will operate as YJ0AVH from next Wednesday the 25th until Friday the 27th and from Monday the 30th until Wednesday the 1st of June on 15, 20 and 40 metres, SSB only.

Now the rallies for today Sunday the 22nd of May:

The Gloucester Radio Rally is being held at Nass Lane, Quedgeley, Gloucester, located off the old Bristol road. Look for the signs for Quedgeley Rally. Doors open at 9am. The event features a car boot sale, a bring and buy stall and a flea market area.

The Moray Firth Amateur Radio Rally is being held at the New Elgin and Ashgrove Public Hall, Land Street, New Elgin. Doors open at 12 noon, at 9am for taking in items for the auction. Event also features a bring and buy stall, and an RSGB stand. Refreshments will be available.

The 37th Northern Mobile Rally is being held at the Flower Show Hall, on the Great Yorkshire Show Ground, Harrogate, North Yorkshire. Entry and parking is off the Wetherby to Harrogate Road and there are separate arrangements for disabled visitors to enter the showground from Hookstone Wood Road. The showground opens at 10am and the rally doors open at 10.30am. Visit the usual trade stands, a bring and buy stall and equipment checks will be carried out by the Harrogate Repeater Group. Refreshments will be available.

Next the two rallies we know of for next Sunday the 29th of May:

The East Suffolk Wireless Revival's Ipswich Rally takes place at the Maidenhall Sports Centre, Stoke Park High School, Ipswich. Doors will open at 10am, and the rally will include trade stands, local club stands, a bring and buy stall and a car boot sale. A new feature this year will be a drive-in Antenna Test facility. There will also be a Novice stall, a vintage wireless show and much more to see. Refreshments will be available. Talk-in will be on 2 metres channel S22 by GB4SWR. Further details available from Bob, G7HZV on 0394 271257 or 0473 645885.

The Plymouth Radio and Electronics Fair is to be held at Coombe Dean School, Charnhill Way, Elburton, Plymouth. Doors open at 10.30am. The event has over 25 stalls featuring electronic, computer and radio components, a large bring and buy stall and a bookstall. Refreshments will be available throughout the day. Talk-in will be on 2 metres on channel S22. Further details available from Derek, G7ESZ on 0752 364150.

Next some dates for your diary:

This year's RSGB Headquarters Open Day is scheduled for Saturday, the 4th of June. The perfect opportunity to call in and meet the staff, and have a tour round the building. There will be various trade and local club stands, and refreshments will be available. Admission from 10.30 until 4.30pm. A map of how to reach headquarters appears in June RadCom.

The next RSGB Regional Meeting takes place at Brighouse in West Yorkshire on Sunday the 5th of June. These meetings are for members and non-members of the Society to meet Council Members, Society Officers and staff to discuss the workings of the Society and amateur radio related matters. For further details, contact RSGB Zonal Council Member Peter Sheppard, G4EJP, on 0964 550397.

HF contest news now:

The CQ WPX CW Contest takes place from 0000 on Saturday the 28th until 2400 on Sunday the 29th of May, using all bands from 1.8MHz to 28MHz but excluding the WARC bands. No other information available but see March RadCom page 18 for other details.

The RSGB National Field Day (HF) Contest takes place from 1500 UTC on Saturday the 4th until 1500 UTC on Sunday the 5th of June. See February RadCom for further details.

Next some VHF contest news:

The RSGB 144MHz Single, Others and SWL Contest finishes today Sunday at 1400 UTC. See the February edition of RadCom for further details.

The first of the RSGB Back-Packers 144MHz Contests also takes place today Sunday the 22nd from 1100 until 1500 UTC. This is a new type of contest and full details can be found in January's RadCom.

The RSGB 50MHz Trophy Contest will takes place on Saturday the 4th of June from 1400 until 2200 UTC. There are five sections, Multi Operator Fixed or Portable, Single Operator Fixed or Portable and Listeners. See February RadCom page 83 for further information.

Special event stations this month include:

GB50DD will be operating from the Military Vehicle Rally, Southsea Common from Thursday the 26th to Monday the 30th. Operation to be on all modes and all bands. For further details contact Stuart, G0FYX on 0705 472846.

GB0BOF will be aired by members of the WACRAL, The World Association of Christian Radio Amateurs and Listeners from "The Royal Mission to Deep Sea Fishermen" at Overgang Road as part of the Brixhams Heritage Week activities. The station will be operational from next Friday the 27th, until Monday the 30th of May, on 80, 40 and 20 metre bands from 10.30am each day.

Castles on the Air 1994, takes place next weekend, Saturday the 28th and Sunday the 29th. GB8RC will be aired from Rockingham Castle, operated by members of the Kettering and District Amateur Radio Society. GW2OP from Pembroke Castle, manned by the Pembroke Amateur Radio Club and GB2CPC at Penrhyn Castle, Bangor. In all six castles are expected to take part. Contact Len, G0RDV on 0536 514544 for further information.

And now the solar factual data

The period 9th to 15th May has seen very low solar activity, but a lot of coronal holes went by, pushing geomagnetic levels up to storm at higher latitudes. The solar flux levels saw a very welcome and steady increase from 77 units up to 91 units. There were a number of small B type flares reported on the 11th and 12th, the largest being a B9.

The sunspot indices averaged 44 but rose from only 12 on the 10th up to 77 by the 15th, the highest level for 2 months. Solar flux levels also rose from 77 units on the 9th, up to 91 units by the 15th, giving an average of 85 units for the period. The 90 day mean solar flux level was 87 units on the 15th. The geomagnetic activity has been up to storm levels at high latitudes most of the period; this was due to the passage of coronal holes, causing very high levels of electron fluence. The only quiet day was the 13th when the Ap indices was only 6 units. The period averaged an Ap index of 22.5 units. The state has been 'mag storm' most of the week. The aa indices as supplied by the British Geological Survey for the 3rd to 9th May gave an average of the daily index as 54.2 nanoTeslas, about K4 though periods on the 5th, 6th, and 7th, were up to 102 nanoTeslas about K5. The monthly average aa index for April was 40.2

nanoTeslas, the only quiet days were the 28th and 30th down to only 4 nanoTeslas, and the most disturbed was the 17th up to 97 nanoTeslas.

The X-Ray flux levels have shot up, possibly due to the flare activity and reach A9.4 units on the 12th, the highest level since last March, with the period averaging A7.1 units. It seems likely that the recent restructuring of the sun's surface is now settling down and more stable conditions will result.

I'll repeat the figures. Spots - 44; Flux - 85; Ap index - 22.5; X-ray flux - A7.1.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers as reported by Meudon averaged 7.1MHz, though levels rose from 6.2MHz on the 10th up to 7.9MHz by the 15th, with peak levels being around 19.00 hours most days. The darkness hour lows have also risen, from 2.6MHz on the 10th up to 4.6MHz by the 15th, with the average being 3.4MHz centred about 04.00 hours. This is more like the levels we would expect due to the seasonal changes taking effect.

I'll repeat the figures. Highs - 7.1MHz; lows - 3.4MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg have been very depressed due to the magnetic storms, with the daylight averages being only 5.6MHz. The darkness hour lows averaged 2.8MHz.

News has been received that on the 1st and 2nd May during the aurora, W2CAP/1 and W3 stations heard TV stations on 49.72MHz, on the great circle bearing, believed to be by auroral E shortly after midnight until 0240 hours.

I'll repeat the figures: Highs - 5.6MHz; lows - 2.8MHz.

And lastly the solar forecast:

This week the more active side of the sun will be coming into view. Solar flux levels are expected to be about the 80s, and geomagnetic activity is expected to be quiet at first, increasing to disturbed by the end of the week. Ionospheric levels during daylight are expected to have MUFs up to 24MHz in the south and 21MHz in the north. East/west contacts will be difficult, though sporadic E may assist. The darkness hour lows are expected to be up to about 14MHz in the south and 10MHz for the north.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 Uniform Whiskey and G7 Sierra Juliet series, and Novice calls in the 2 0 Alpha India and 2 1 Delta Alpha series. .

--

GB2RS is prepared by the Radio Society of Great Britain and is broadcast
in the 80m, 40m, 6m and 2m bands.

2377. first QSOs

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-19 20:27:42 UTC
From: oo7@astro.as.utexas.edu
Message-ID: <2rgi3u$9bs@geraldo.cc.utexas.edu>
Source record: 266872

donrm@sr.hp.com (Don Montgomery) recalls:

>>It was the thrill of a lifetime, what with a 10-week old kitten
>>climbing up my pantsleg and being half bombed on the old man's beer.

I wouldn't want a half-bombed kitten climbing up my pantsleg either.

Hmmm, well, my first QSO was sort of bootlegged as well, or would have been, had it worked. I borrowed a 2-watt 80m rig from my Elmer and for some reason when I attempted to answer a CQ for my first QSO I sent the call of the club station I belonged to, rather than my own. I have no idea why I did that. It didn't matter, since I forgot to switch the antenna over to 'transmit' anyway.

After two weeks I was a pro and had 11 countries worked with those 2 watts on 80, the best DX being Finland (I was a G3 at the time). I even wrote up the experience for The Shortwave Mag, a fairly glossy mag published in the UK at that time (1958, ack). I still have a photocopy of the article.

When I got licensed here after a lapse of 25 yrs or so, I was not going to let it take up as much time as it did earlier, was just going to have a few casual QSOs now and then when I felt like it. Only have 10 countries left to work now.... There are lots of books on how to get into amateur radio, none on how to get out again.

In article <1994May19.122030.10042@colmiks.com> psc@colmiks.com (Philip Cook (Halgren)) writes:
When you set the PL tone, do it while you are not in the memory channels. You must set it first before you save it as a channel memory. And make sure you have it turned on while you do save it. I have done it myself and have had no problems with it at all. Here is the way to do it:

You can do it after you've set it in the channel memory. Assuming you've got the memory all set up (including split), here's how to add PL tone:

1. Select the channel.
2. Access the menu. Now you only have 3 options to worry about: transmit frequency and the TX and RX PL tones.
3. Select the PL tones you want for TX and/or RX.
4. Exit the menu by pressing PTT.
5. Turn on tone encoding/decoding (Func-1 I think).
6. Enter new settings into memory (Func-C, hold for one second).

This way you don't affect the VFO settings or the defaults for the radio that are kept in the main menu.

2379. FT-530/Microphone question

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-19 21:19:08 UTC
From: jwdxt@csn.org
Message-ID: <Cq2J7x.7B6@csn.org>
Source record: 266875

I have a new Yaesu FT0530 and bought the display mike with it. A friend and I have done some testing and have noticed that using the mike significantly reduces my output strength. I also got a comment from someone on a repeater while mobile that I had sounded better on a previous QSO, and the difference was again the mike. Should I expect this? Or might there be a problem? I've had the radio almost a week, and I've been a ham for two or three weeks so I'm sure I'm experienced enough to be doing everything right <g>.

Any suggestions are greatly appreciated.

Source record: 266633

Hmmm, I've seen this too (the power save/no receive problem). I wonder if this has anything to do with the recent sale they had on the HTX-202 (quite a significant price cut). If this is a valid bug, will Radio Shack do anything to repair? PS- I thought I was doing something wrong, until I read all these notes & that prompted my interest. I was using the power save along with the tone-receive squelch for the Central Texas net, which uses PL tone. When the power saver was turned off, I was able to receive QSOs in progress.
Also, you can only change frequencies during the time slice when the radio wakes up. In other words, there is no keyboard or control knob interrupt to wake up the sleeping radio.(other than turning off sleep, thank goodness)

I've started a mailing list for Yaesu FT990 owners. If you'd like to subscribe, send a message to 990-request@xyzoom.info.com stating your wish. There are only about 6 subscribers so far, and volume is very low, but perhaps it could be useful (in fact I appreciate low-volume mailing lists better than the other kind). The address for the list is 990@xyzoom.info.com.

: JE>that 99% of the hams would be great and 1% would be idiots. I haven't been
: JE>disapointed! 8-) In fact I was pleasantly surprised to find that it was more
: JE>on the order of a .01% idiot factor. Is Amateur Radio a perfect world? No,

I have been a radio amateur since I was a teenager, back in '66, and in
my opinion amateur radio has never been healthier. The no-code license
has proven to be a fabulous vehicle for bringing new people into the
hobby. The new licensees have proven to be every bit as good as those
from any other era of the hobby (in my opinion) and many many of these
new ops quickly are upgrading to general, advanced, and extra.

The hobby is full of really great folks. The 1% who behave childishly?
Well, what the heck, there aren't many of them, and it's only a hobby?
We all have vfos, nowadays. :-) :-)

Hi. I'll be in the Princeton, NJ region for a couple of months soon. I've applied for a reciprocal permit, but need to find out a couple of things before I get there. First, what is the call area for Princeton (my guess is N2 or W2 but I'm unclear of the significance of the letter!)? Secondly, could some kind soul tell me what 2m frequencies I should try, and whether I need to sort out how to use the tone access options on my HT:-) I'd like to use the opportunity of chatting to some locals! (Most of all I'd like to try to find an HF rig to keep a sched in Australia with, but I realise that could be very difficult)

2391. Re: First QSO

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-20 02:32:58 UTC
From: davros@bga.com
Message-ID: <2rh7gq$av0@edwin.bga.com>
Source record: 266644

Ah, my first QSO... :)

Well now let's see. As I cast my memory back in time ... Oops, I missed. ... :) Let's try that cast again, shall we?.... Ah. Much better.

I got interested in ham radio in 1987, spring. Why? Because of a book I found in the library called _How To become A Radio Amateur_, copyright 1950. I'd heard of ham radio but never saw much in there for me. But I picked up the book anyway, read it, didn't understand some, but did see something there that sounded like a *lot* of fun. So I got more stuff! I learned the code out of a book (and had it all screwed up too, BTW--but that problem soon worked itself out), studied, and, within a couple months I had a receiver to listen to. Eventually I took the test--well that happened in September. One month later--in fact, on October 24, at about oh, I'd say 5:15 or thereabouts, I got my license. Unfortunately, I don't have that original, or for that matter, my first General, or my Advanced ... anymore. :(Ah, for lost history... Needless to say, I was excited! I was a little disappointed though, because I really wanted KB5LID as my call. Why? Oh. That's easy--so I could be a really topknotch op and not be offended if someone called me a lid. I got over it though, because my call had (and, well still does) such a good rhythm on cw. So I practiced up for the first QSO, which I had on a Saturday, November 7 actually, a mere two weeks after I got my license. Nice day, November 7 ... :) I went to my elmer's house (that's Steve, KG5BR) with my straight key. We tuned around on the 15-meter novice band, still one of my favorite bands, by the way, and heard a cq... I was a little nervous, you know, the cold sweaty palms and all that, but I didn't have a problem copying, amazingly enough. But Steve was there to copy along anyhow. My first QSO was with Bob, KA1 JDG (or was is GDJ?), in...I'll be damned...Farmington, CT? I think? I don't even remember! Anyway, I then made another with WA9YMI, switched to 10-meter ssb, made a couple more, then off to 40 cw for another, and then homeward bound. It was great! Oh, and then a few weekends after I worked the 10-meter contest, and a couple months after, Novice Roundup (ended up second in my section if you believe)...

BTW I was probably only one of a few 20 wpm novices for a while, about a month actually, for what it's worth...

Now, 6.5 years later, four licenses up the ladder (Got the Extra two years ago...has it really been that long?), a bunch of QSO's later, I'm still active, and I still love ham radio, and I dearly love cw. Not a big contester though. Ham radio has been one of the best things I've done so far, and it's really become an amazingly important part of my life. Never would have thought, I suppose... :)

First contact on my own rig, now that wasn't nearly as exciting because
it was only across town on 10 meters...

>as "low"!), and I'm having trouble finding Alinco specs on the jacks, etc.
>

Don't worry -- they match fine. The RS mike can be used with any HT
that has the same jack setup, including the Alinco, Icom, Yaseu, and
even perhaps Kenwoods. No problems at all using the RS mike with the
580 -- I've been using one for months.

My first QSO? Well, got my tech (general theory, 5WPM (supertech?)) in August '76, at the NYC FCC test office. Got my callsign sometimw in October (something like 10 weeks delay, things haven't changed much, have they) when I was away at college. was a member of the college ham club WA2SDY (Syracuse U.) and went up to the shack to use my brand new (actally recycled, FCC did that for a while) callsign and got on the HF novice band (think it was 80M). Someone about 10 miles north hears my CW (probably horrible!) CQ and comes back. Mentioned he was my first contact of my ham life, probably made his day. Sent me a QSL card. @nd contact was on 2M voice, haven't touched a code key since.

I'm curious. In the U.S., during the early days of repeaters, burst tones were used to control "which" repeater you brought up. There were some areas with 3-4 machines on the same frequency and you chose which one by which tone you used. What is the purpose of the tone burst in EU, when they all use the same one?

From: csdfg@selway.umt.edu
Message-ID: <1994May20.053952.27888@selway.umt.edu>
Source record: 266653

I found a great FAX program today on oak.oakland.edu. The only problem is the documentation is written in German and I know practically no German. Can anyone help with perhaps the location of the same program written in English, or possibly the name of a comparable program (in English)? The one I got is packed with some neat features and image manipulation. I just wish I had the benefit of English documentation. The program is FAX40.ZIP.

Thanks in advance for any pointers.

Hello all,

I recently got this boat-anchor of a smithsonian piece of Allied radio ax-190 receiver, and I need to do some internal fixing on the thing. I would stand a much better chance if I could find the documentation for this thing. (I'd ask allied if they had extras if they were still around! :) I just know one of you guys out there with a club like the one I'm in has one of these things sitting in the back corner, and probably have the docs for it. I dunno, e-mail and we'll figure it all out.

THANKS A TON!!! (that's about what this thing weighs ;)

Yes this problem appears to be inherent in all the HTX-202 radios.
I had it too and checked with R.S. to see if they had a service bulletin
out about it, but no luck (but this was over a year ago and they may
have admitted it since then). I thought about sending it back but it's
not important enough to me to lose the radio for a few weeks. It did
cause some embarassing moments when I stepped on people who had
been using the repeater for several minutes, though ;-) I just disabled
power-save and now I'm a happy camper.

Hi all,
a friend of mine just purchased the Radio Shack 440 HT. It's a nice rig but uses the old drop pl on unkey but transmit a little longer w/out to prevent chicken scratch while the repeater resets trick. I don't recall what this "feature" is called. Is there any way to turn the feature off without turning off PL?

Thanks,
Dan

I know a Gary in Lawrenceville GA. I wonder if Larry from this months QST lives in Gawrenceville. It seems pretty strange that an article about us would show up in a period when HQ's participation seems to be dwindling, and written by someone who's .sig isn't very common here. Funny how they mentioned the occasional flame wars but didn't bother to discuss the, IMHO more offensive, arguements and vulgarities on certain parts of the SSB subbands of HF.

cheers,
Dan

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

2408. FCC 610 "official" color ? (was: 610 Form in PostScript)

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-20 08:02:41 UTC
From: bencze@elvira.stanford.edu
Message-ID: <BENCZE.94May20080241@elvira.stanford.edu>
Source record: 266660

Howdy all,

The discussion about printing .ps forms for submission to the FCC brings up a question. What is the "official" color of the new 610 forms? 10 weeks ago I picked up a xerox copy of a new 610 form from HRO which was printed on a light beige paper, not the "goldenrod" color paper of the old 610 forms.

Has anyone seen an FCC-issued new 610 form? If so, what color is it? ("old"/beige/other). I hate to think that my long awaited new callsign application was circularly-filed because the color of the paper was a bit off...

Tnx es 73, Bill KD6TOB (hope to be KO6A? soon...)

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
May 20 to May 29, 1994

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008
SKYCOM Announcement: (403) 756-2386

- -

A M A T E U R R A D I O C L U B S S P E C I A L O F F E R

Amateur radio clubs can now purchase our powerful SKYCOM High-Frequency Ionospheric Signal Analyst propagation software at $139.00 dollars each (with a manual on-disk) or $167.00 (with a paper-printed manual), provided the club orders at least 3 copies of the software for their members. This is a savings of 29%.

To qualify, include the name of the club, a phone number to a club contact person, and the names and addresses of each of the three or more club members purchasing the software. Remit a check or money order made payable to the "Solar Terrestrial Dispatch" for the appropriate amount ($139.00 x number of copies) and send it to the address given at the header of this report. We will ship the software within 24 hours of receiving the order.

A M A T E U R R A D I O C L U B S S P E C I A L O F F E R

- -

For more information regarding the new SKYCOM HF Propagation software, call the recorded SKYCOM announcement (approx 3 minutes) listed above or send e-mail to: Oler@Ultrix.Uleth.CA. This is a software package no serious radio communicator or listener should be without.

| Geomagnetic Field |Fri|Sat|Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun| Anomaly |
| Conditions | Given in 8-hour UT intervals | Intensity |
|_____________________________________________________________________________|
```

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

------------------------------------------------------------
Chart Start Date: Day #080
```

NOTES:
This graph is determined by plotting the greater of either the planetary A-index or the Boulder A-index. Graph lines are labelled according to the severity of the activity which occurred on each day. The left-hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

```

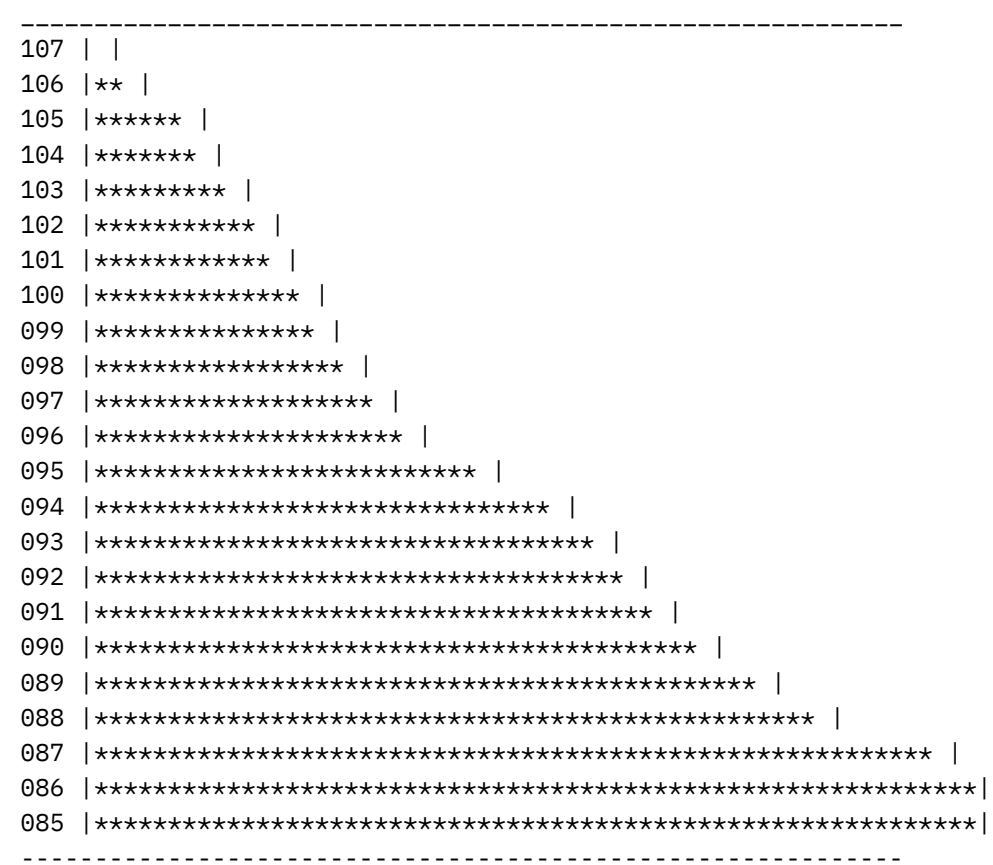
GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts.

The Ham Radio & More Show will feature a discussion on packet and the Internet this Sunday, May 22, 1994. The guest will be Dan Meredith, N7MRP. The show airs every Sunday at 6:00pm EST. It is on the Talk America Network and has been on the air for over 3 years now. It can be found in over 20 markets and on Spacenet 3, Transponder 9, 6.8 audio for TVRO satellite.
Senator Barry Goldwater, K7UGA will be the guest June 26.

73, Len

Hi Guillermo

You wrote;
|already have an FCC Form 610A. In one of the questions, the US mailing
|address is requested, however, I still don't have one, can I just put
|San Francisco or should I use someone else's address in that city?

No, you don't need the mailing address in th US. Just put your current
Mexican address on the form610A. FCC will send the permit to your
address in 3/4 weeks.

FCC , Gettysburg will work for the address..

Tack JE1CKA/KH0AM (past KH0/JE1CKA as reciprocal permit)

Charles is right. Almost every repeater in Germany has to be opened by
transmitting the 1750 Hz tone. If there are two or more repeaters in an
area, then the are using different frequencies.

If you like to know details on repeater locations and frequencies just
ask.

I have working lately with the commerical applications and have seen
software available to produce to the forms required. Most companies
producing the software place a notice the FCC has not offically
endorsed the electronic filing or reproduction of the forms. However,
the Paper Reduction Act of whatever year it came out mandates a certain
date by which all government agencies should accept electronic filing
and the such. I work at Wright Patterson AFB where we use PerForm Pro to
prepare alot of our forms, there is a DOD agency in Arlington VA
that produces these offical forms but, the people to whom these forms are
submitted place all kinds of silly restrictions on their
use just because they do not look like the orignals in some small way.

What I have observed in the government change must be made slooooowly
in order to prevent "future shock". Additionally, this could be an easy
way to reduce one's work load by rejecting a paper that is not as "offical
looking".

Propagation Forecast Bulletin 20 ARLP020
>From Tad Cook, KT7H
Seattle, WA May 20, 1994
To all radio amateurs

SB PROP ARL ARLP020
ARLP020 Propagation de KT7H

Solar activity was up a bit last week, and there was even a period when the geomagnetic activity was quiet. Solar flux was higher by a average of about 13 points compared to the previous week, and May 12 and 13 had some periods when the K index was as low as one.

Solar flux should very gradually decline over the next couple of weeks, reaching a low around 75 at the end of the month when a recurring coronal hole returns to view. At that time conditions will be very disturbed for at least a week.

Sunspot Numbers from May 12 through 18 were 45, 71, 67, 55, 58, 59 and 58, with a mean of 59. 10.7 cm flux was 87.4, 89.5, 90.2, 91.4, 91.4, 95 and 93.6, with a mean of 89.8.

The projection for this week is from the Hawaiian Islands to the Mariana Islands.

80 meters looks good from 0830 to 1630z, with the peak period from 1100 to 1530. Check 40 meters from 0700 to 1730, and 30 meters from 0600 to 1830. 20 meters should be open from around the clock, except around 1800 to 1900. The best period on 20 meters should be from 0830 to 1600. 17 meters should be good from 2000 to 1200, peaking toward the end of the period. Check 15 meters from 2130 to 0830, and on some days until 1100. 12 meters should be open from 2230 to 0600, and 10 meters from 0000 to 0500.

Are these Mhz versus KC people putting us on? They've gotta be.

Had us going for a nanosecond there, guys! :-)

Very funny!! I know what you meant to say, and I probably would not have said anything at all except for the idiots on usenet who keep repeating that CYCLES is the same as CYCLES PER SECOND. They are not the same. Sure, Kc/s was used for a long time, and now KHz is the convention. May be when someone said Kc almost everyone else understood that he/she meant Kc/s, but that doesn't make it correct.

My point above was that simplicity in key strokes does *not* always guarantee what you type is simple to understand--as you seem to think. Simplicity is not a word that can stand alone (just like CYCLES when you mean CYCLES/SECOND. :)

(By the way, I grew up with the termonology Kc/s, and I have even heard--infrequently--Kc. However that does not make Kc correct, and anyone who preaches that it is correct should have their error pointed out. I hope if I would make a similar blunder, that someone would have the decency to point it out in as civilized a manner as I and many of the other people here have, until some idiots decided that since I'm not 10000000000 years old that I have no idea what I'm talking about.)

Christof A Neumann (neumann@Informatik.TU-Muenchen.DE) wrote:

: Charles is right. Almost every repeater in Germany has to be opened by
: transmitting the 1750 Hz tone. If there are two or more repeaters in an
: area, then the are using different frequencies.

No wonder. It s the same here in France. 1750 Hz but for the transponders,
which are normally "transparent" - always opened. In France, repeaters also
have a timeout (90 s), meaning that if you don t let a "K" or "T" go by,
you are fired after the delay. I dunno about German repeaters.

> has proven to be a fabulous vehicle for bringing new people into the
> hobby.

I'm glad that amateur radio in your area is healthy. In this area its
in poor health, slowly approaching what amateur radio has become in
southern california. Most of the problems have been with CBers coming
into the hobby and bringing their bad habits with them. 90% of the
callsigns I hear on local 2 meter repeaters are N1xxx no-code calls.
The elmers have fled to the safety of private repeaters or other bands.

I polled the current subscribers and so far the feedback I've gotten
is yes, we should make it include the 1000. I didn't want this to be
a big undertaking, however, in that I don't really have time to
maintain a large list, and I only have a simple alias file here for
it--

If anyone knows where to get a listserver program for SYSVR3/uucp
Unix, please let me know.

> cardboard toilet-paper tubes. My rigs reflect simplicity. So does `kc'
> (fewer keystrokes).

When did the electronics pros and academia have the battle over "Hertz" vs "Cycles per second"? the late 1960s? (that seems right - i don't have access to the IEEE publications of that era right now and it seems like it settled out around that time [Siemens for "mho" also has occured as well..])

Everyone in the pro electronics (and other engineering worlds) uses Hertz as a unit of measure of frequency. IF there are still extant any official documents that use cycle per second as a frequency measurement, it's because it's not been worked on in the last 25-35 years or it's an old copy.

But in Amateur Radio, by crackies, we're going to stick with the old jargon because that's the way I learned it 50 years ago. And we all know that radio development halted when the first amateur license appeared - only amateur radio can be the starting point of a new technology.

It's this kind of nonsense that causes many professionals in the electronics world to stay quiet about their amateur radio license - they're embarrassed to be associated with people that refuse to even learn the jargon basic to the science that makes the whole thing possible in the first place.

Maybe we should see if the Society for Creative Anachronism (the knights in shining armor and damsels in distress folks) wants to start an alchemists branch where we can keep alive the techniques and jargon from the start of radio time. Spark and arc transmitter demos on Saturday just before the jousting tournament...

There is something to be said for doing it with toilet paper rolls and bailing wire, but that's like keeping your Duesenburg or Stutz running and then trying to race with Indy cars.

Absolutely! It could even cause a solder joint to fail, which is by far the
most likely culprit from the description of the symptoms.

>Question 2: Is just the CPU screwing up, as the problem is intermittant...
>yet more times broke than correct...
>
>Question 3: If it is the CPU, what is the procedure for resetting the CPU?

I seriously doubt the CPU is involved in this problem. If the Tx indicator
is on, the VCO should be operating and the PLL locked. The problem is much
more likely to be in the driver or PA stage. Most likely culprits are solder
joints in a coil or transistor (internal). First you need to make some tests
to see *where* in the transmit chain the power is being lost. Listen on a
receiver and see if you hear a weak signal with modulation when transmitting.
If you do, the VCO/PLL and modulator are fine. Next check the output, or
collector current, of the driver stage. If you're getting several milliwatts
out, or you see several tens of ma current flow, then the driver is likely
OK. Next move to the PA. I'm not familiar with this particular radio, but
I suspect it uses a power "brick" module. Inspect all the solder joints in
the external circuitry, try to measure current draw of the module, etc.
I strongly suspect that there's an intermittant *inside* the brick. Try
hitting it with some freeze spray and see if it starts working, or quits,
due to the thermal shock. If it does, replace it.

>(Gary Coffman, any ideas? You seem to be omniscient (grin).

Thanks, I think. Intermittant problems can be a bear to track down.
Freeze spray and a heat gun are your friends as most intermittants
respond to thermal cycling. Almost always they are the result of a

bad connection somewhere in the circuit (often internal to a component).

Gary

>or down to 80m?

Up to 80m, of course. 160m has always been known as `top band'.

>>Dr. Loomis was a dentist. If I remember correctly, he used a non-powered
>>system where he simply connected his "transmitting" antennae to ground via
>>a telegraph key. I assume that at all time a very small potential
>>difference existed between the antennae and ground, when the key opened and
>>closed, a small current flowed and excited the antennae at its resonant
>>frequency. I'm not sure what he used as a detector, but it did work.

Thanks; a very nice summary. The site where these experiments took place is near my home, in the Virginia mountains west of Washington, DC; there's a historical marker there. His "antennas" were very long vertical wires supported by kites. Loomis thought he was somehow tapping into a flow of aetheric energy moving through the sky. What he was really doing was electromagnetic induction, powered by the atmospheric potential difference between ground level and the top of his skywire some hundreds of feet up. A true pioneer, he was right for all the wrong reasons.

Bob Keller writes:

>It's probably not historically accurate to attribute the _invention_ of
>radio to Marconi, but he seems to have been first out the blocks in terms
>of its commercial exploitation!

I agree. Others, most notably Tesla, preceeded Marconi. At the time Marconi sent his single-letter message accross the Atlantic (no mean feat, to be sure), Tesla was giving public, and well-documented, demonstrations of radio-controlled model boats and submarines at Madison Square Garden, and in the Hudson. Some of his models were powered entirely by the received radio energy, including their propulsion motors. It is certainly true, however, that Marconi was streets ahead of Tesla in the practical application of radio to communications, much to the distress of Tesla's financial backers, who thought they were paying for the development of a wireless telegraph system.

MICHIGAN QSO PARTY

TWO PERIODS GMT

1800Z Sat. May 21 to 0300Z Sunday May 22
1100Z Sun. May 22 to 0200Z Monday May 23

The 1994 Michigan QSO Party will be sponsored by the Oak Park Amateur Radio Club. Phone and CW are combined into one contest. Michigan stations can work Michigan counties for multipliers. A station my be contacted once on each band/mode. Portable/mobiles may be counted as new contacts each time the county changes.

EXCHANGE: RS(T), QSO#, QTH, County for Michigan; State or Country for others.

SCORING: Multipiers are counted only once. _Michigan Stations_: 1 point per QSO x (States + Countries + Michigan counties) on phone. Each CW contact is 2 points per QSO. Alaska and Hawaii count as states. VE counts as a country. Maximum multiplier is 85. Five (5) points for each W8MB contact. _Non-Michigan-Stations: QSO points X Michigan counties. 1 point for each Michigan phone QSO and 2 points for each CW contact. Five points for each club station contact with W8MB/W8MB/mobile. Maximum multiplier is 83. VHF only entries: Same as above except multipliers per VHF band are added together for total multipliers. No repeater contacts are allowed.

SUGGESTED FREQUENCIES: CW - 1810, 3540, 3725, 7035, 7125, 14035, 21035, 21125, 28035, 28125.

PHONE - 1855, 3905, 7280, 14280, 21380, 28580.
VHF - 50.125, 145.025, 146.52

AWARDS: _MICHIGAN:_ Plaques - High Multi-operator/single transmitter score, High Michigan Score, High Michigan (Upper Peninsula) score, High aggreate club score and High QRP only entry (Minimum of 1000 QSO's), and High Michigan Mobile score. _Certificate:_ High score for each country (Min.50 QSO's). _OUT-STATE_: High Out-State plaque and certificates for High Score each state and country.

A log and summary sheet is requested showing the scoring and other pertinent information, name and address in BLOCK LETTERS, and a signed declaration that all the rules and regulations have been observed. Michigan stations include club name for combined club score. Party contacts do not count toward the Michigan Achievement Award unless one fact about Michigan is communicated. Members of the Michigan QSO Party Committee are not eligible for individual awards. Decisions of the Contest Committee are final. Results will be final on July 30, 1994 and will be mailed to all entries that have sent in a SASE. Mailing deadline is July 1, 1994. Send logs to:

2439. Edge of Space Sciences Balloon Flight over Colorado

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-20 16:20:44 UTC
From: rickvg@cscns.com
Message-ID: <CLDtjSEHGoKO063yn@cscns.com>
Source record: 266669

```
--------------------------
FLIGHT PROFILE FOR EOSS-17
--------------------------

LAUNCH DATE : June 4,1994

BACKUP LAUNCH DATE: June 5,1994

LAUNCH TIME : 16:00 UTC

LAUNCH SITE: NAVSYS Corp.
Monument, Colorado, USA
Take the Baptist Rd. exit from I-25, go west to
WoodCarver Rd. (the first left) then south to
NAVSYS Corp.

LAUNCH SITE COORDINATES: latitude 39.09165 deg North
longitude 104.87129 deg West

FLIGHT EXPERIMENT: Flight Qualification of the "New Flight Controller,
Shuttle II"

EXPERIMENT CONDUCTED BY: Jack Crabtree/AA0P and the rest of the gang at EOSS

PROJECT INTEGRATOR: Jack Crabtree/AA0P

FREQUENCIES:

Shuttle II:

Telemetry 144.290 MHz (AX.25 Packet - Plain Text)

ATV 426.250 MHz

Tracking Beacon: 147.555 MHz (CW FM)

HF Net: 7230 kHz LSB + or - QRM

Tracking and Recovery Team: 146.970 MHz Repeater

PURPOSE OF THE FLIGHT:

Flight qualification of the EOSS standard balloon bus, "Shuttle
II." Shuttle II consists of an improved balloon controller designed and
built by Bob Schellhorn, W6ORE, based on the 80C552 microprocessor chip.

Flight tests of a new Global Positioning System (GPS) system will
also be made.
```

Once qualified, Shuttle II will be pressed into service on future flights involving student designed and built experimental payloads. The W6ORE controller will support a wide variety of experiments limited only by the experimenter's imagination. GPS will provide precise tracking information. This will provide a more accurate data track of the path and altitude of the payload throughout the flight thus offering experimenters more precision in the analysis of their data.

PAYLOAD SYSTEMS:

A five channel Magellan OEM/5V GPS receiver board will provide Altitude, Latitude, Longitude, Course, Speed, Range and Bearing to the Launch Site data on the packet telemetry AX.25 downlink. This is the first flight for the GPS system.

Internal and external temperature and barometic pressure (included as altitude) will be included in the packet telemetry signal.

An Automatic Position Reporting System (APRS) compatible packet position message will supplement the above information on the telemetry downlink frequency. APRS users in ALL states adjacent to Colorado should "hear" the payload as it approaches maximum altitude.

Amateur Television will be transmitted from the payload. A black and white camera will send down views of the ground, horizon and balloon and parachute.

Hope to see you all at the next flight of EOSS.

: to "true hams" there are lots of 'em on CW.

We certainly agree that HF is fun, but I've got to argue with your comment about 80 at night, and with the "true hams" bit as well. Over the last winter, I spent more time operating 80 than any other band. Since evenings are the only real time I have to operate, and with current band conditions being what they are, my choices for operating narrow to 40 and 80 for much of the winter.

I've had a super time on 80 and thoroughly enjoyed myself. I've ragchewed, participated in some nets with generally good folks, worked DX, and 49 states (sigh... no Hawaii till next season I fear). Yes there are jerks on 80 in the evenings. There are also some terrific folks there. As the sunspot cycle continues its plunge towards minimums I think it's particularly important not to give up on any of the low bands. C'mon people. When the thunderstorms begin to subside next fall, and 80 opens to some long-haul possibilities, give it a try. You might be pleasantly surprised!

As to the "true hams" remark, please be fair. There are "true hams" operating every mode and every band. Let's be inclusive, not devisive.

: Let's hang in there and
: quit putting up with this kind of junk!

I completely agree.

Source record: 266675

Greetings,

I just wanted to know why is it that Northern Ontario Canada has
left out of the ARRL and other repeater directories? Amature radio is
alive and well in Northern Ontario and provides importaint emergency
communications for the north. Has any other locality been left out of
the repeater directory? Who actually makes the repeater directories, are
they on internet? How can I get Northern Ontario repeaters listed again?

Hi Joe, take a look at the 580 schematic. On the stereo mike jack (JK603)
you have a 100 ohm resistor (R602) to 5v. When you use the RS speaker-mike,
you are wasting 50 mA. Of course, it works... it just runs your battery
down faster. If you're satisfied with that drain, that's fine. I just
wanted to warn everyone who has not bought a speaker-mike yet.

:with other operators, and to engage them in interesting conversations on
:a near daily basis. That's rather rare on HF, except on 75 meters, and
:that's such a zoo of noise and interference that the contacts are rarely
:pleasant.

Well there's one man's view, and if you take Gary's comments at face value, you'd believe that HF is a wasteland of "59... also 59, QRZ?". A quick tune around any of the bands will tell you otherwise. What you'll really find, with the exception of major contest weekends, is pockets of DX'ers exchanging signal reports and moving on, completely surrounded by lots of folks chewing the rag. Yes, even on bands like 20 meters, and especially in places like 12 and 17. Some of the conversations are dull, boring and without much content, some are fascinating. Just about like all of the other amateur bands. I meet pretty much the same group of folks daily on V/UHF and have made some new local friends. I meet lots of different folks on HF, and have made a few long distance radio friendships as a result as well.

Listen up on HF. Don't just focus on the activities that annoy you. I find just as many or more interesting conversations on HF as V/UHF. But HF offers a taste of the exotic, and opportunities to easily talk to someone outside of your local repeater group. Personally, I really enjoy both activities, and wouldn't sell either short.

See my comments on 80 meters in another posting. The noise and interference are bad in the thunderstorm months, but winter is a whole 'nother ballgame. The low bands can be fun too.

Message-ID: <94May20.113214-0600.18436@scapa.cs.ualberta.ca>
Source record: 266545
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

There is conficting information for scoring in the previous posting
entitled MICHIGAN QSO PARTY MAY 21,22

In the cover letter (shown at the beginning of the posting), CW contacts
are worth 2 points whereas PHONE contacts are worth 1 point. The scoring
sheet (later in the posting) shows the reverse. This information
is exactly as I received it in the printed documents.

At the club meeting last night, the gentleman introducing the information
stated that CW contacts are worth 2 points and PHONE contacts 1 point.
Please correct your scoring sheet to reflect these changes.

Jeff Johnson, KF8UW.

>What ?

No one knows, not even ARRL. It isn't an acronym as far as anyone can determine from history back to 1900. The only suggested origin I've ever heard is that some British radio enthusiasts started using the term "am" as short for "amateur" (i.e., "My neighbor is a radio am"). Since "Cockney" lingo drops the letter h from the front of words which begin with h (as in "I'm going 'ome now."), it has been suggested that a listener may have thought a Britisher saying "am" really meant "ham" but was dropping the h. Hence, the beginning of the term "radio ham." It may be a pretty weak argument, but traditions have begun in other pursuits from even more inauspicious origins.

DX is an internationally-recognized abbreviation for "distance" and goes back to early radiotelegraph days of ships at sea. In fact, most abbreviations used today trace their origins back at least that far, and in some cases all the way back to the days of the landline telegraph. A few were chosen from non-English languages for their brevity; for example, the use of "DE", as in WA3XYZ DE K4MSG. "DE" is French for "from", but it is shorter in terms of characters and character elements than, say, "frm" or even "fm" (with the latterrunning the risk of being interpreted as "frequency modulation," although admittedly FM was developed long after "DE" came into use by radio telegraphers. In CW, "DE" vs "FRM" would be -../. versus ..-./.-./-- so it would save time. It seems a small thing, but when handling CW traffic through the static crashes on LF, using (ugh!) spark, every little bit would help.....

Oops, sorry about that! If it was "spark" it wouldn't be
"CW", would it? After all, "CW" is "continuous wave".....I
goofed! Sorry about that!!! It should say "...when handling
radiotelegraph traffic..." which covers spark, CW, MCW or any
radio on-off keying mode which uses Morse or International
Morse code.

: > my opinion amateur radio has never been healthier. The no-code license
: > has proven to be a fabulous vehicle for bringing new people into the
: > hobby.

: I'm glad that amateur radio in your area is healthy. In this area its
: in poor health, slowly approaching what amateur radio has become in
: southern california. Most of the problems have been with CBers coming
: into the hobby and bringing their bad habits with them. 90% of the
: callsigns I hear on local 2 meter repeaters are N1xxx no-code calls.
: The elmers have fled to the safety of private repeaters or other bands.

I think you are over generalizing a bit. The no-code technician license
has brought a wealth of future amateur operators. In my opinion, the 2
meter band has become sort of a novice testing ground. Some stay as no-code
techs, others fall by the way side and drop out of the hobby, while
yet others realize that there is more to ham radio than rag chewing on
a repeater. The last group ends up either upgrading and gets involved in
HF activities or stays on the VHF side of things and get into emergency,
packet, or whatever. This is quite evident by the recent growth in the
QRP clubs across the country.

Stating that your problems have been with CBers coming into the hobby is
taking the easy way out. At one time, I would guess that 50% of the adult
population in the United States owned a CB (my guess only). I think the
real problem is that we are overloading the front end. The VHF repeaters
are becoming congested. Have you ever been on a major highway when it has
become congested? It brings out the worst in people.

OK....

We think we might have the problem licked...maybe... I know a few folks
locally that were experiencing similar problems on Icom x8 series radios...
and they just did a software reset and it worked correctly...

Anyway, we did a reset on it (finally found it in the book...william swore
it was not in there... I found it plain as day...

Anyway, we did the reset and the rig is working fine...for now...it was
a nice cool night up here in Gainesville last night...so it might still
need some reworking... could indeed be a problem in the VHF pa.

Thanks for the help, though Gary...let's hope that it was indeed firmware
and not hardware (grin)/....

Also, thanks for the reply --- you the only one!

I use a Kenwood TH-28A here to great effect ! It comes with a receive only feature on UHF that fits the bill nicely. My query relates to programming the actual coverage via the internal diode matrix. Presently the set covers 136- 174 MHz & 400 - 520 MHz (Rx only) It seems (via a friendly dealer here in NZ) that shifting around the 8 tiny diodes on 1 PCB will alter actual coverage .... I'm keen to extend down to 118 MHz VHF to receive aircraft band, but don't want to lose the great UHF spread ! Perhaps some one has the full service manual out there ? HAS ANY ONE HAD EXPERIENCE WITH THIS MOD ? THE ACTUAL SMD DIODES ARE SO TINY THAT MY SOLDERING IRON WILL HAVE TO BE FILED TO A PIN !! Thanks in anticipation ..... 73 de Zl2AJZ

Here's another possible source: Webster's defines a "ham"
actor as one who is considered incompetent. Since that term
applied to an actor may predate the invention of wireless (maybe
even by a couple of hundred years or more), it could be that
the term "ham" operator was applied as a DEROGATRY name by
professional wireless operators, especially in the days preceding
regulation and licensing after WWI, when amateurs were notorious
for cluttering up the spectrum and interfering with commercial
wireless. In other words, to the professional wireless operator
the amateur was the radio equivalent of a "ham" actor; i.e.,
basically incompetent.

: Jeff NH6IL

The CHP uses 42.xxx MHz. There are some frequencies for local gummint such as the AQMD there, but it's mostly U.S. Government frequencies. So there are some active frequencies. There are some old mobile telephone channels in th middle of 35MHz. Lifeguards are on the low end of 37MHz. I remember that the L.A. Sheriff's office used the high end of the 30's, up around 39MHz. But I think they've all gone to trunked systems on 800MHz. If you use the R/C in a large metro area, you can probably expect interference.

Anyone know the internet address of the FCC database for California? I telnetted into it once and used it, but I can't find the address. It'll let you search by frequency, licensee name, etc. I found out that there is a Marriot hotel on our frequecvy and it's just a few miles down the road. The people at work that have radios don't seem to complain, because their PL tones are different. But it's hard to monitor on a scanner.

Interesting. Well, should we ever converse I'm likely to give you a chuckle. I talk about my xx meter antenna, because that is the *common* designator for referring to an antenna for a given amateur band. In other words, it's clear in meaning resulting in effective communication. I refer to its height above ground in feet when speaking to US operators because that is the way most of us are comfortable in referring to and understanding distances. In other words, it's clear in meaning resulting in effective communication. When speaking to many non-US operators, I'll give antenna height in meters because, well... you get the idea.

Methinks with all of this talk of kc vs Hz, finger pointing and laughing, we all sometimes look too hard for things to disagree with and make fun of, and not hard enough for common points of interest and agreement. It's pretty easy to sit back, pick and make fun. It's much harder to see someone else's point of view and at least attempt to appreciate, if not agree with it.

Text item: Text_1

>Where a dit is "_" and dah is "-" and it's easier to type; you merely
>toggle the shift key to go between a dit and dah.

Let's get away from this obsolete dit/dah stuff. HEXly-coded-ASCII
makes a lot more sense. Note how much more efficient this is than
dits and dahs.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 20/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 20 MAY AND FORECAST UP TO 23 MAY

No warning is current.

1A. SOLAR SUMMARY
Activity: Very low

Flares: None

Observed 10.7 cm flux/Equivalent Sunspot Number : 90/34

1B. SOLAR FORECAST
21 May 22 May 23 May
Activity Low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 90/34

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet to unsettled

Estimated Indices : A K Observed A Index 19 May
Learmonth 08 2322 2311
Fredericksburg -- 15
Planetary -- --

Observed Kp for 19 May: 3433 3222

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
21 May 15 Quiet to unsettled.
22 May 10 Quiet.
23 May 10 Quiet.

2C. MAGNETIC COMMENT
Ap and Afr indices not available.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND

DATE LOW MIDDLE HIGH
20 May normal normal normal
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
21 May normal normal fair
22 May normal normal fair
23 May normal normal fair
3C. GLOBAL HF PROPAGATION COMMENT
HF conditions should remain normal-fair until May 27.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values

Observed T index for 20 May: 44

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
21 May 45 Near predicted monthly values.
22 May 50 About 10% above predicted monthly values.
23 May 50 About 10% above predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
Spread F may degrade communications during night hours.

>the repeater directory? Who actually makes the repeater directories, are
>they on internet? How can I get Northern Ontario repeaters listed again?
>

The info in the ARRL repeater directory comes from the repeater
coordination groups or the repeater owners; if a group or owner doesn't
submit the info, the ARRL can't print it. That's probably why the
Northern Ontario info isn't in there.

To get them listed in the next edition, you have to get the folks who
coordinate or keep some type of list of repeaters in that area to send
the list to the ARRL. Or, the individual repeater owners have to
submit the info themselves, on the forms found in the back of the
repeater directory.

It's probably because none of the repeater ops sent in an update.
ARRL gets the info for the directory from the trustees or
coordinating bodies. It should be explained in the RD somewhere.

MD>I'm glad that amateur radio in your area is healthy. In this area its
MD>in poor health, slowly approaching what amateur radio has become in
MD>southern california. Most of the problems have been with CBers coming
MD>into the hobby and bringing their bad habits with them. 90% of the
MD>callsigns I hear on local 2 meter repeaters are N1xxx no-code calls.
MD>The elmers have fled to the safety of private repeaters or other bands.

It is unfortunate that the elmers are fleeing. Being a newly liscensed
ham since January of this year I sure have appreciated the help that
more experienced hams have given me on the air.
If I make a misteak (spelling not included) then take the time to
correct me, but don't run away in disgust.
I was encouraged to get my code requirements because it was the only way
I was going to be able to use my HF rig, I didn't have a 2m rig at the
time. Having spent the time to learn code did not teach me any operating
skills/etiquitte, I am learning this from patient listening to advice.
If anything, the code requirements only taught me to be patient.

I doubt I'll ever use code again, I prefer digital modes on HF.
And hopefully I'll be able to contribute something to the hobby in the
way of my computer skills and yearn to learn.

You don't give enough detail about your circuit to make a definite choice, but I would be extremely inclined to use a low-end microcontroller here. Depending on the device you select, you should easily be able to set up a selectable delay accurate to anywhere from one microsecond to .1 millisecond.

For that matter, why not do the whole thing in a microcontroller?

Heck, get yourself a copy of the ARRL Maidenhead Grid maps for North America. You'll find that North America ends at about latitude 51 N. I pointed this out to some nice person at ARRL HQ and they sent me a *World* Maidenhead locator, which did indeed cover my QTH (55N 113W).

This anecdote is symptomatic of a certain kind of USA-centric thinking which I've come to associate with our good southern friends :). I've got to point out in all fairness that they corrected their gaffe for free.

>expect interference.

It's interesting to look at the 30-50 MHz allocations and see that there's an imaginary dividing line at 42 MHz, with a variety of services below it and an equally wide variety (including many of the same services) above it. The reason is that there were various broadcast allocations below 50 MHz before World War II -- most notably FM broadcasting from 42-50 MHz, starting in 1940 -- so land mobile stopped at 42 MHz. 42-50 didn't become available for land mobile until 1948, after the FCC gave up on the idea of using 44-50 MHz for low-power TV (that was the old channel 1), and when it did the FCC didn't move the 30-42 stuff around.

Hi Jim...

I think Gary Coffman summed it up quite well...although, I do hope it is not
a hardware problem....sheesh....well, at least it is not my money...it's
william's (grin)...

Anyway, we did try the CPU reset as laid out in the manual (hold set and
mw while turning on rig...) and the problem so far seems to be licked...

William says he is going to use the radio a whole lot more and see if the
problem resurfaces....I just hope it is some kind of glitch in the CPU...
William says it's putting out power...just hardly any... I dunno...

We reset the thing the other night...it was quite cool...in the 60's or so,
and the rig acted like it was supposed to....but I'm going to wait and see
what surfaces after a few days and few good days of operating...

I have a similar problem with an Icom 38A, but I just cycle power and flip
thru the memory channels and it goes away!

Good luck...oh BTW, his is also a 3220H, not an "A" as originally posted!

John

>Actually, only the USA has not yet adopted the system accepted worldwide as
>the standard for DAB. (Mostly because of intense lobbying by commercial AM
>and FM broadcasters who see it as new competition in an already competitive
>market.)

Yes indeed, there may be other developped countries in the same
situation
but i don't know wich ones. The WARC (ITU) 1992 has officially adopted the
L
Band (1452-1492MHz) as the worldwide band for DAB radio. And the americans
don't want to use that band but prefer to continue to use MW and FM bands
for
DAB. Two main arguments for using this new band for DAB is the bandwith
available and the ability to receive also from satellites. Hence the actual
DAB standard is a data flow of 1.5 million bits/sec compressed to .25
million
bits/sec using a bandwith of 1.5MHz per stereo service (6 services per
channel). So, that standard is unapplicable to the MW band(0.01MHz bandwith)
and the FM band (0.25MHz). That's why americans must develop a different
standard. Acording to the Canadian plan all MW and FM broadcasters should
have migrated to the L band by 2010 sharing all the same audio quality and
extra services(too long to explain here).

Extracted from an Industrie Canada leaflet printed in 1993 is a view of
the american position on DAB. This was written by the work group on DAB

implantation, consisting of representants of broadcaters industries and government.

" Why the USA does not adopt the L Band for DAB?

Actually the L band is not available for DAB in USA. Besides, many american broadcasters are opposed to it's use because they maintain that DAB in the L band is a menace for existing radio stations. Acording to these broadcasters, the introduction of DAB radio stations working on the L band would create a third band added to to MW and FM. The stations operating in this new band, in wich audio quality would be superior,
would grab some publicity revenues to traditional AM and FM stations who already have difficulties to make profits in a saturated american market. To overcome the menace posed by DAB broadcast in the L band some american
companies and broadcasters are jointly working on a DAB standard that could be operated in the MW and FM bands.
They have yet to proove that the proposed standard, known as IBOC (intraband in the lane (my translation)) could be exploited satisfactorily as
well in the MW and the FM band. We cannot dare say there is no solution in this avenue, but many international experts doubt that this american initiative can produce real improvements. Most countries want their future digital services to be coming as well from earth based transmitters as satellites. In view of the propagation caracteristics of the MW and FM bands the IBOC system won't be usable by satellites.
The problem is that even if the IBOC system could work well in labs it might not be so in real world. It might not overcome the problems of fading and multipath linked to FM transmission. So it is unlikely that the IBOC system's efficiency would surpass analog FM enough, specially in the case of car reception.
For the MW band even with the reduced need in bandwith arising from data compression the band isn't wide enough specially if you have to transmit as well the traditional MW service along with IBOC services. Besides at night there are serious jamming problems due to other stations that could cause an important degradation of DAB broadcasts in this band.
Consequently it is likely that any feasable IBOC exploitation would be in
the FM band to the detriment of MW stations. Then the actual inequalities between MW and FM stations wich made havoc to MW stations exploitants in the unregulated US radio market, would only increase if such a solution would be retained.
IBOC cannot offer real improvements to broadcasters and listeners. And obviously, if the listeners don't beleive taht DAB is realy superior they will buy the radios. "

Actually some of the long term tests are going on here in Montreal. If i could tune to 1468.75MHz i would hear the digital broadcast of 6 local stations repeated on the same channel. 10 prototype receivers made by the Eureka 147 consortium(Phillips, RCA-GE, Telefunken and Grundig) are in use

somewhere around the town. The first production models should appear in 1995.
Other companies: Pionner, Sony, Kenwood, and Delco have asked for licences. It is expected Delco (a GM subsidiary) will be a big player in this field since it is making half the worlds car radios, and the rate of renewals of cars is quite high and the fact that 55% of radio listening is done in cars make the car radio the major port of entry of DAB.

2482. Contest Information via EMAIL

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-21 08:32:45 UTC
From: mike@imcldn.demon.co.uk
Message-ID: <769509165snz@imcldn.demon.co.uk>
Source record: 266529

Can anyone point me to an FTP site, or can lead me t e-mail addresses for contest information. I am looking mainly for the non-UK ones, ie ARRL,CQ Mag etc.

Any help appreciated

73 Mike

The 3-Hr Ap Indices for 19 MAY 94 are: 15 25 18 18 13 6 7 8
Greater than 2 MeV Electron Fluence for 20 MAY is: 1.1E+09

SYNOPSIS OF ACTIVITY

Solar activity was very low. Just two spotted regions are
visible, 7722 (N09W41) and 7727 (N09E27). Both have been
stable.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field was quiet to unsettled. The greater
than 2 MeV electron fluxes remained at moderate to high
levels.

Geophysical activity forecast: the geomagnetic field is
expected to persist at quiet to unsettled conditions
throughout the forecast period.

Event probabilities 21 may-23 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 21 may-23 may

A. Middle Latitudes
Active 25/20/15

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

I don't know why anyone would say that Southern California amateur radio has been invaded by CBers. Nothing could be further from the truth. Southern California amateur radio has been invaded by ENTHUSIASTIC NEW HAMS virtually all of whom are FB ops! And as far as all the elmers fleeing to the private repeaters, rubbish. We have as nice a cross section of hams on 2 meters as you could ask for, and virtually all of the repeaters on 2M are characterized by courteous, excellent operating practices. Incidentally, scores and scores of the new no-code folks out here are upgrading to advanced and extra! FB! HF bands look out, new blood is on the way.

I've been a radio amateur since 1966, and I've never seen our hobby as healthy as it is now.

We have a few problem ops, and a few jammers. Mostly they congregate in one or two spots, and the rest of us ignore 'em.

What IS true, is that in Southern California, back when coordination of VHF/UHF was new, a bunch of old boys got themselves appointed as coordinators for 440. These chaps then assigned THEMSELVES virtually all of the 440 repeater pairs, which they proceeded to designate as closed or private. This has effectively shut the average ham out of the 440 band in Southern California, which is unfortunate.

Over 90 percent of repeaters in Southern Cal are closed to virtually all hams, and this IS unwholesome. Eventually we will do something about it, however.

: Over 90 percent of repeaters in Southern Cal are closed to virtually all
: hams, and this IS unwholesome. Eventually we will do something about it,
: however.

What about it makes it "unwholesome"? Do these "closed" repeaters also
suffer the same or higher level of jamming, obscene/foul language, etc.
that the more "wholesome" open repeaters have?
There is certainly nothing "illegal" about a closed repeater, right? Or,
has there been a new FCC (not ARRL) edict on this? I know we don't
"own" the airwaves, but there's nothingin the rules that I've read that
says that ALL repeaters are owned by the public.
So, would it be better if there were FEWER total repeaters and more
simplex channels or, should we have more repeaters and make all of them
"open", or what?

AND, out of curosity, just exactly who is the "we" that are going
to do something about the unwholesomeness of closed repeaters?
And just what and when would "we" do it?

73 de Sandy
WA6BXH - slay@netcom.com
PS: I don't live in California and have only very, very rarely used a
repeater - open or closed, during my own 30+ years as a ham; so I
admittedly don't know much about the problems which may exist there
and don't have much of an opinion - other than to ask what others
mean by theirs. ;-)

> possible impedance mismatches, etc.

The radio shack mike is wired the same as an ICOM spkr/mike, which is WRONG for the Alinco. Alinco uses a stereo mike plug (the small one) and uses the RING of the connecter to send 5 volts to the mike. If you use a R/S or Icom mike, you will short out this 5 volt supply. It doesn't damage anything, but it reduces your battery life by as much as 50%. The only spkrmics I've seen that will work are the Alinco and the tiny MFJ.

2493. IPS Daily Report - 21 May 94

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-21 23:24:57 UTC
From: rwc@flare.syd.ips.oz.au
Message-ID: <1994May21.232457.172@ips.oz.au>
Source record: 266540
Cross-posted to: aus.radio,ips.solar.activity,rec.radio.amateur.misc,rec.radio.info

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 21/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 21 MAY AND FORECAST UP TO 24 MAY

IPS Warning 14 will be issued later today for interval May 24-25
(coronal hole).

1A. SOLAR SUMMARY
Activity: a

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 088/032

1B. SOLAR FORECAST
22 May 23 May 24 May
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 086/029

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet to unsettled

Estimated Indices : A K Observed A Index 20 May
Learmonth 08 3222 3211
Fredericksburg 05 07
Planetary 08 09

Observed Kp for 20 May: 2322 2322

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
22 May 10 Quiet to unsettled.
23 May 10 Quiet to unsettled.
24 May 18 Active.

2C. MAGNETIC COMMENT
A coronal hole visible in the northern hemisphere has grown
since the previous rotation. This hole is expected to raise
geomagnetic activity to active levels during 24-25th. Also,

the southern coronal hole that is thought to be associated with
the recent lengthy disturbed intervals, is just appearing on
the east limb of the Sun.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
21 May normal fair fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
22 May normal normal fair
23 May normal normal-fair fair
24 May normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
Conditions are now expected to remain normal until May 24, afterwhich
conditions at mid, and high lats can be expected to degrade.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values

Observed T index for 21 May: 46

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
22 May 50 About 10% above predicted monthly values.
23 May 50 About 10% above predicted monthly values.
24 May 40 Near predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
Strong spread F observed during local night, and is again expected
during local night tonight. Degraded comms conditions are expected
during the interval May 24-25 due to expected coronal hole sourced
activity.

2494. FCC licensing delays

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-22 00:04:00 UTC
From: darryl.linkow@ledge.com
Message-ID: <cf.5398.438.0N2EEB85@ledge.com>
Source record: 266563

Hello all! I have now been waiting for 7 weeks for my first
license to arrive in the mail. Having read all the horror stories
on the nets regarding waiting times, I decided to call the FCC in
Gettysburg and find out what the REAL problem is myself. I spoke
to a very nice woman who told me that it is now taking from 12 to
14 weeks to process application forms because there is only ONE PERSON
keying in the information to the computer. Also, she said that
the "new computer" that people have talked about on the nets is not
online yet. (Hmm...it only took me a couple of hours to set up my
latest 486 box!). At any rate, this ONE PERSON evidently has
thousands of licenses to process. The woman told me that she had
not heard of any offers from the ARRL regarding local volunteers in
the Gettysburg area coming in to help out with the backlog and
enter data into the computer. I told her that since we have
volunteers doing license testing, at no charge to the Federal
government via the VEC program, it seems that we could have
volunteer personnel to perform data entry! She also told me that
the Gettysburg office has requested additional help several times from the
Managing Director of the FCC in Washington, D.C., but the man
refuses to give them any more employees, for even a short period of
time, to clear up the backlog of license applications. I have
called my local Congressman, Representative Anthony Beilenson, and
told one of his staff about the problem. I asked if the
Congressman could contact the Managing Director and ask for some
additional staffing in Gettysburg, at least on a temporary basis,
to get the backlog of amateur radio applications (Form 610)
processed. Perhaps if everyone told their respective Congressman
about the problem, we could get some help! Here is the name,
address, and phone number of the FCC Managing Director who will not
let Gettysburg have any additional people to help get rid of the
backlog: Andrew Fishel
Managing Director
FCC
1919 M Street, N.W.
Washington, DC
(202) 632-6390
Just as an aside, I decided to get my amateur license because of
the problems associated with the January 17 earthquake here. The
American Red Cross had a severe shortage of qualified amateur radio
operators to handle emergency traffic after the earthquake. So, I
decided, as a citizen of the community, that I would get my
license, so that I might get involved in disaster communications,
and be ready to assist, if needed. But, as of right now, I can not
participate in any emergency networks until my license arrives!!

Also, I am routing a copy of the above information to President Clinton and Vice President Gore. I understand that Vice President Gore is very interested in information processing and bottlenecks in those areas of the government that are having problems processing data.

I am open to discussing this with anyone on the net, but if you want to work for the improvement of this problem, please call or write to Mr. Fishel and your elected federal government officials in Congress and The White House.
Sincerely,
Darryl Linkow (no callsign after 7 weeks and don't expect to see one for another 5 to 7 weeks!)

>: MD>The elmers have fled to the safety of private repeaters or other
bands.
>

The problem is the same it was when I got my ticket 17 years ago, a few bad ops stand out, the good ones are transparent. There have ALWAYS been trouble makers on the bands but as always, they eventually burn out and get replaced w/new ones...just turn the frequency dial and they disappear. The only problem w/some new ops is some of these folks can't even figure out how to measure the SWR on their antennas until it's too late; these few individuals have missed the point of the hobby...

>Actually (and most folks don't know this) HAM is an acronym for (H)ave
>(A) lot of (M)oney!

I would have said hardly any money ;).

But it's NOT an acronym. Repeat, NOT an acronym. Ham, hams, but not
HAM. The only HAM I know of is an obscure video mode on Amiga
computers.

Where did this wearisome idea that it has to be an acronym come from,
anyway? The theatre's had hams from time immemorial without getting
this strange idea into its' collective head!

I am totally new to ham, but would like to learn. I live near Worcester, MA
If anyone has suggestions as to groups (esp. w/ address or phone #) near
Boston or Worcester I'd be thankful for info. Also if anyone has suggestions
on gear that would be good to start with, that'd be great. (especially cheap
sources for used stuff). Thanks for any tips.
Colin
PS I may not reply promptly because I don't access this account much!
If possible, please sent it to my e-mail as opposed (in addition) to posting.
Thanks!!!

: 50mA only when you're transmitting, from what I can see. Joe Salemi, KR4CZ

Joe, ask yourself if it makes sense to have 5v available for VOX purposes only when you're transmitting... the 5v has to be there during receive for the VOX to work... 5v is there all the time and the RS speaker/mike is shorting it out through a 100 ohm resistor. Now 50 mA is no big deal, but it is something. Keep your RS speaker/mike plugged in full time and see how long the battery lasts. Why do you think ICOM, Alinco, and MFJ have stereo plugs on their mike inputs?

Agreed. Julian N6ARE and I are still on our crusade to try to find the origin of HAM - not 'ham', but HAM in capitals. Whenever someone posts to say that they are "interested in getting into HAM" we write them nice notes to ask why they capitalize it. Most people ignore us, and of those who answer, most say "I don't know, I thought that was how you were supposed to write it", but offer no reason why they think that.

We can only think that it is by analogy with CB, which is capitalized, and which does indeed stand for something. We've seen the capitalized version used by people who already have licenses, but it's mostly used by those outside the hobby. Isn't there anyone here who used to spell it that way, now spells it with lower-case letters, and can tell us why they used to use capitals? We could then stop worrying about it, and spend more of our time actually doing HAM - um.

From: slay@netcom.com
Message-ID: <slayCq6y2s.G56@netcom.com>
Source record: 266560

First QSO .....

Well, I can't remember my own, for some reason ..... but I do remember
a few others.

Story #1:

Back in 1969, a new Novice appeared on the bands who (I later learned)
lived about 500 yards from me. When I would come home from school, I
would get on the air, and there he would be .... calling CQ CQ CQ CQ CQ
for (honestly) 10 minutes at a crack. Even when I tried answering him,
he would not reply .... he just kept calling CQ. I'd reduce power,
do everything I could think of ... but nothing worked.

A couple of months later, the new Callbook came out and I finally found
the address for "Paul". Turns out, he went to the same high school.
Well, he told me that he had yet to make a QSO using his DX-60 and
WW2 vintage AR-88 receiver. He did not quite understand how to zero
beat the rcvr to his xmit frequency ... so I helped him out on that.
Then, after calling <a short> CQ, we waited. Another station came
back, but Paul didn't realize it. So, while I copied the call he
got ready to xmit. Like many first timers ... he didn't know quite
what to say ..... so, I wrote down on a piece of paper the stuff he
should say .... name, QTH, RST, etc. Well, Paul turned into quite
a Ham after that..... it was simply a case of a newcomer in need of
a little help. It felt good to be an Elmer for the first time.

Story #2

While living in Japan, I helped several other expatriate "newcomers"
make their first QSOs (both phone and CW) while there. It was lots
of fun, but the one that I recall with the most fondness was being
on the receiving end of a first QSO.

It was about 2am local time and I was scanning the low end of 20m cw
for some DX when I came across a fairly good signal - VK2GPN was calling
CQ at "maybe" 3 or 4 wpm. Well, he was treading in DX territory and
he clearly wasn't setting the key on fire ..... so I answered him
(at 3-4 wpm). Turns out that "Tony" had been on phone for some time,
but had never operated CW and was nervous as can be. His confidence
grew minute by minute. By the end of our 2 hour long QSO his code
speed had improved dramatically - I attribute that to overcoming his
initial nervousness and being so exhausted that he couldn't waste
the time translating the sounds of Morse back and forth into the
alphabet. (Students of a foreign language may recognize this
effect after a long period of intense concentration, or .. a few

alcoholic drinks ... hihi).

Anyway, we exchanged a couple of long hand-written letters and photos.
I sent him one of those "FIRST QSO" certificates that the ARRL provides.
I understand it now hangs proudly in his shack. The QSO was a memorable
one for both of us, I think.

After sharing the experience with some other "old cw hands", they too
decided to go QRS/Novice hunting and thoroughly enjoyed the experience.
I guess because it reminded us so much of our own first QSOs.

The 3-Hr Ap Indices for 20 MAY 94 are: 7 15 10 6 9 12 9 7
Greater than 2 MeV Electron Fluence for 21 MAY is: 1.3E+09

SYNOPSIS OF ACTIVITY

Solar activity continued at a very low level. Only minor
evolution occurred in the two spotted regions. A moderate size
coronal hole is visible in the northwest quadrant. This hole is
larger than last rotation.

Solar activity forecast: solar activity should be at
a very low level for the forecast period. Region 7722 (N09W54)
poses a slight threat of a C-class flare.

The geomagnetic field was predominantly quiet for the period.
Energetic electron fluxes were at a moderate to high level.

Geophysical activity forecast: the geomagnetic field
should be quiet to slightly unsettled through 23 May.
Mostly unsettled to slightly active levels are forecast on
24 May in response to the coronal hole mentioned above.

Event probabilities 22 may-24 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 22 may-24 may

A. Middle Latitudes
Active 20/20/30
Minor Storm 05/05/10
Major-Severe Storm 01/01/05

B. High Latitudes
Active 20/25/30
Minor Storm 05/05/15
Major-Severe Storm 01/01/05

HF propagation conditions were normal over all regions.
No changes are expected over the next 3 days, through 24 May
inclusive. Normal conditions should persist.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

2507. [Summary] Kenwood TH-78A *OR* Yaesu FT-530

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-22 09:05:46 UTC
From: steve@vigra.com
Message-ID: <STEVE.94May22020546@hobbes.vigra.com>
Source record: 266562
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

A while back I was following the thread on the Kenwood TH-78A vs.
Yaesu FT-530, and I thought I'd post a summary of what I learned from
y'all, since it seems there's a few other people out there faced with
the same choice.

First, I had a lot of incorrect info in my post. Specifically:
- The Yaesu digital microphone is NOT alphanumeric.
- CTCSS *does* come standard with the Kenwood in the U.S. Other
countries maybe not, so check.
- The Kenwood keypad *does* light up with the display, just like the Yaesu.

All told, it sounds like the two radios are very close in features.
Only the Kenwood has alphanumeric memory, but it costs you half of
your slots. An expansion to 250 memories (125 alpha) is available,
but the standard memory (50) is less than the Yaesu (82).

The Yaesu has an internal voltmeter, PL tone search, and Vox built in.

Some say that the keypad on the Yaesu is a bit easier to use because
it does't have the sliding cover like the Kenwood. Others like the
cover.

Apparently, the antenna that comes with the Kenwood is not too good,
and it's a little shorter than the Yaesu's. Some recommend a
third-party add-on duckie.

As far as reception, they sound pretty much the same. The Yaesu may
have a little better intermod rejection, but not that much.

The decision???
I chose the Yaesu FT-530, and have had it for about a few weeks now.
I like it very much, but it has a few ergonomic snags. I also did the
recieve-only expansion mod (13 & 15), and it seems to work fine. I'll
probably post a summary of my impressions after I give it a few more
weeks. By then, I may even have paging figured out. :-)

Thanks very much for all your input, especially Marc Wollemborg
<mrw13@columbia.edu> for passing info along. My thanks to:

>expect interference.

It's interesting to look at the 30-50 MHz allocations and see that there's an imaginary dividing line at 42 MHz, with a variety of services below it and an equally wide variety (including many of the same services) above it. The reason is that there were various broadcast allocations below 50 MHz before World War II -- most notably FM broadcasting from 42-50 MHz, starting in 1940 -- so land mobile stopped at 42 MHz. 42-50 didn't become available for land mobile until 1948, after the FCC gave up on the idea of using 44-50 MHz for low-power TV (that was the old channel 1), and when it did the FCC didn't move the 30-42 stuff around.

CS>I found a great FAX program today on oak.oakland.edu. The only problem is
....
CS>just wish I had the benefit of English documentation. The program is
CS>FAX40.ZIP.

Take a look around for JVFAX60.ZIP You shouldn't have any problems finding it.

Anyone know how to hook this program up to a tnc instead of a homebuilt circuit?

Subject: Ham Radio few problem
To: info-hams@ucsd.edu

MD>I'm glad that amateur radio in your area is healthy. In this area its
MD>in poor health, slowly approaching what amateur radio has become in
MD>southern california. Most of the problems have been with CBers coming
MD>into the hobby and bringing their bad habits with them. 90% of the
MD>callsigns I hear on local 2 meter repeaters are N1xxx no-code calls.
MD>The elmers have fled to the safety of private repeaters or other bands.

It is unfortunate that the elmers are fleeing. Being a newly liscensed
ham since January of this year I sure have appreciated the help that
more experienced hams have given me on the air.
If I make a misteak (spelling not included) then take the time to
correct me, but don't run away in disgust.
I was encouraged to get my code requirements because it was the only way
I was going to be able to use my HF rig, I didn't have a 2m rig at the
time. Having spent the time to learn code did not teach me any operating
skills/etiquitte, I am learning this from patient listening to advice.
If anything, the code requirements only taught me to be patient.

I doubt I'll ever use code again, I prefer digital modes on HF.
And hopefully I'll be able to contribute something to the hobby in the
way of my computer skills and yearn to learn.

Don't worry -- they match fine. The RS mike can be used with any HT
that has the same jack setup, including the Alinco, Icom, Yaseu, and
even perhaps Kenwoods. No problems at all using the RS mike with the
580 -- I've been using one for months.

Subject: HTX-202 question
To: info-hams@ucsd.edu

karayannopoulos,george (karayan@blitzen.cc.bellcore.com) wrote:

: SOME of the repeaters I want to get into require a PL tone, so I program that
: in the memory. The problem is that when I recall such a repeater freq from the
: memory, the SETTINGS are OK, but it does not automatically turn the PL tone
on.
: So, I transmit but do not raise the repeater. I have to remember that this rpt
: requires PL tone, to turn the tone on manually before xmitting. Wouldn't be
: easier to automatically turn it on if the recalled memory requires a PL tone
: on xmit? Can the HT still do that? How?

When you set the PL tone, do it while you are not in the memory channels.
You must set it first before you save it as a channel memory. And make sure
you have it turned on while you do save it. I have done it myself and have
had no problems with it at all. Here is the way to do it:

1. Set your HT up to the frequency you want.
2. Remember to add the split setup of what the repeater uses.
3. Go into the menu section and stop on the PL tones (Rc and tx or tc)
4. Set the PL tones to what you need for the repeater.
5. When those are set, get out of the menu and turn on your T-Sql.
6. Set the memory channel that you want to put it under. (Actually this
should be first).
7. Do the M-WR command(writes to the memory).
8. Check this by switching over to the M-CH to make sure it is set
correctly.

This should be correct.

I have used my HTX-202 for over a year now, and I have not had many problems
with it at all. As a matter of fact, a friend of mine recently checked my HT
out on a spectrum anyalizer and found that it performs much better than many
of those other HT's.

Hope this helps you out.

> Jim Ley, NX9F
Hi Jim...

I think Gary Coffman summed it up quite well...although, I do hope it is not
a hardware problem....sheesh....well, at least it is not my money...it's
william's (grin)...

Anyway, we did try the CPU reset as laid out in the manual (hold set and
mw while turning on rig...) and the problem so far seems to be licked...

William says he is going to use the radio a whole lot more and see if the
problem resurfaces....I just hope it is some kind of glitch in the CPU...
William says it's putting out power...just hardly any... I dunno...

We reset the thing the other night...it was quite cool...in the 60's or so,
and the rig acted like it was supposed to....but I'm going to wait and see
what surfaces after a few days and few good days of operating...

I have a similar problem with an Icom 38A, but I just cycle power and flip
thru the memory channels and it goes away!

Good luck...oh BTW, his is also a 3220H, not an "A" as originally posted!

John

>Question: could the heat built up inside the car destroy a componet on the
>radio?

Absolutely! It could even cause a solder joint to fail, which is by far the
most likely culprit from the description of the symptoms.

>Question 2: Is just the CPU screwing up, as the problem is intermittant...
>yet more times broke than correct...
>
>Question 3: If it is the CPU, what is the procedure for resetting the CPU?

I seriously doubt the CPU is involved in this problem. If the Tx indicator
is on, the VCO should be operating and the PLL locked. The problem is much
more likely to be in the driver or PA stage. Most likely culprits are solder
joints in a coil or transistor (internal). First you need to make some tests
to see *where* in the transmit chain the power is being lost. Listen on a
receiver and see if you hear a weak signal with modulation when transmitting.
If you do, the VCO/PLL and modulator are fine. Next check the output, or
collector current, of the driver stage. If you're getting several milliwatts
out, or you see several tens of ma current flow, then the driver is likely
OK. Next move to the PA. I'm not familiar with this particular radio, but
I suspect it uses a power "brick" module. Inspect all the solder joints in
the external circuitry, try to measure current draw of the module, etc.
I strongly suspect that there's an intermittant *inside* the brick. Try
hitting it with some freeze spray and see if it starts working, or quits,
due to the thermal shock. If it does, replace it.

>(Gary Coffman, any ideas? You seem to be omniscient (grin).

Thanks, I think. Intermittant problems can be a bear to track down.
Freeze spray and a heat gun are your friends as most intermittants
respond to thermal cycling. Almost always they are the result of a
bad connection somewhere in the circuit (often internal to a component).

It's probably because none of the repeater ops sent in an update.
ARRL gets the info for the directory from the trustees or
coordinating bodies. It should be explained in the RD somewhere.

I polled the current subscribers and so far the feedback I've gotten
is yes, we should make it include the 1000. I didn't want this to be
a big undertaking, however, in that I don't really have time to
maintain a large list, and I only have a simple alias file here for
it--

If anyone knows where to get a listserver program for SYSVR3/uucp
Unix, please let me know.

You)ve got long feet, I m only 46.
Well, at least in France - we have invented the metric system so we are
not caught in abysmal thoughts when we speak about a 10 meters beam with
5 millimeter element diamter 15 meters above the ground. :-)
Sometimes I wonder why you keep your incredibly complex system. Odd :-)

Of course no offense meant.

Vince, F1RCS.

To all radio amateurs

SB PROP ARL ARLP020
ARLP020 Propagation de KT7H

Solar activity was up a bit last week, and there was even a period when the geomagnetic activity was quiet. Solar flux was higher by a average of about 13 points compared to the previous week, and May 12 and 13 had some periods when the K index was as low as one.

Solar flux should very gradually decline over the next couple of weeks, reaching a low around 75 at the end of the month when a recurring coronal hole returns to view. At that time conditions will be very disturbed for at least a week.

Sunspot Numbers from May 12 through 18 were 45, 71, 67, 55, 58, 59 and 58, with a mean of 59. 10.7 cm flux was 87.4, 89.5, 90.2, 91.4, 91.4, 95 and 93.6, with a mean of 89.8.

The projection for this week is from the Hawaiian Islands to the Mariana Islands.

80 meters looks good from 0830 to 1630z, with the peak period from
1100 to 1530. Check 40 meters from 0700 to 1730, and 30 meters from
0600 to 1830. 20 meters should be open from around the clock,
except around 1800 to 1900. The best period on 20 meters should be
from 0830 to 1600. 17 meters should be good from 2000 to 1200,
peaking toward the end of the period. Check 15 meters from 2130 to
0830, and on some days until 1100. 12 meters should be open from
2230 to 0600, and 10 meters from 0000 to 0500.

As opposed to "short dead dipoles"?????----------^ :)

My first rig was a Heathkit HW-16. I built it but it didn't work. I had an
"elmer" who was not a ham, but had been a radio operator in the Navy. He
helped (translated: I watched while he worked) me get the thing working by
locating a bad solder joint or several and a few other fixes. The light bulb
I brought for a dummy load finally (no pun intended:) lit up.

This is where my memory gets fuzzy. My first contact was with WN4LUR in
Tennessee
on 40 CW (7175000000 mc to bring another thread into the fray, or is that to
fray
another thread :-). I don't remember much about the QSO itself except
the butterflies and shaking that I experienced. I have a QSL for the contact.
The callsign database says that WB4LUR is still licensed. I want to
get in touch with him as the 25th anniversary of that QSO approaches. I was
a 15 years old in June 1969 when I made my first contact.

I have 4 or 5 logbooks filled, too, but back then I listed every CQ and every
call which went unanswered.

Subject: First QSO
To: info-hams@ucsd.edu

Ah, my first QSO... :)

Well now let's see. As I cast my memory back in time ... Oops, I missed. ... :) Let's try that cast again, shall we?.... Ah. Much better.

I got interested in ham radio in 1987, spring. Why? Because of a book I found in the library called _How To become A Radio Amateur_, copyright 1950. I'd heard of ham radio but never saw much in there for me. But I picked up the book anyway, read it, didn't understand some, but did see something there that sounded like a *lot* of fun. So I got more stuff! I learned the code out of a book (and had it all screwed up too, BTW--but that problem soon worked itself out), studied, and, within a couple months I had a receiver to listen to. Eventually I took the test--well that happened in September. One month later--in fact, on October 24, at about oh, I'd say 5:15 or thereabouts, I got my license. Unfortunately, I don't have that original, or for that matter, my first General, or my Advanced ... anymore. :(Ah, for lost history... Needless to say, I was excited! I was a little disappointed though, because I really wanted KB5LID as my call. Why? Oh. That's easy--so I could be a really topknotch op and not be offended if someone called me a lid. I got over it though, because my call had (and, well still does) such a good rhythm on cw. So I practiced up for the first QSO, which I had on a Saturday, November 7 actually, a mere two weeks after I got my license. Nice day, November 7 ... :) I went to my elmer's house (that's Steve, KG5BR) with my straight key. We tuned around on the 15-meter novice band, still one of my favorite bands, by the way, and heard a cq... I was a little nervous, you know, the cold sweaty palms and all that, but I didn't have a problem copying, amazingly enough. But Steve was there to copy along anyhow. My first QSO was with Bob, KA1 JDG (or was is GDJ?), in...I'll be damned...Farmington, CT? I think? I don't even remember! Anyway, I then made another with WA9YMI, switched to 10-meter ssb, made a couple more, then off to 40 cw for another, and then homeward bound. It was great! Oh, and then a few weekends after I worked the 10-meter contest, and a couple months after, Novice Roundup (ended up second in my section if you believe)...

BTW I was probably only one of a few 20 wpm novices for a while, about a month actually, for what it's worth...

Now, 6.5 years later, four licenses up the ladder (Got the Extra two years ago...has it really been that long?), a bunch of QSO's later, I'm still active, and I still love ham radio, and I dearly love cw. Not a big contester though. Ham radio has been one of the best things I've done so far, and it's really become an amazingly important part of my life. Never would have thought, I suppose... :)

First contact on my own rig, now that wasn't nearly as exciting because it was only across town on 10 meters...

Subject: first QSOs
To: info-hams@ucsd.edu

donrm@sr.hp.com (Don Montgomery) recalls:

>>It was the thrill of a lifetime, what with a 10-week old kitten
>>climbing up my pantsleg and being half bombed on the old man's beer.

I wouldn't want a half-bombed kitten climbing up my pantsleg either.

Hmmm, well, my first QSO was sort of bootlegged as well, or would
have been, had it worked. I borrowed a 2-watt 80m rig from my Elmer
and for some reason when I attempted to answer a CQ for my first QSO
I sent the call of the club station I belonged to, rather than my own.
I have no idea why I did that. It didn't matter, since I forgot to
switch the antenna over to 'transmit' anyway.

After two weeks I was a pro and had 11 countries worked with those
2 watts on 80, the best DX being Finland (I was a G3 at the time).
I even wrote up the experience for The Shortwave Mag, a fairly glossy
mag published in the UK at that time (1958, ack). I still have a
photocopy of the article.

When I got licensed here after a lapse of 25 yrs or so, I was not
going to let it take up as much time as it did earlier, was just
going to have a few casual QSOs now and then when I felt like it.
Only have 10 countries left to work now.... There are lots of
books on how to get into amateur radio, none on how to get out
again.

: JE>disapointed! 8-) In fact I was pleasantly surprised to find that it was

more
: JE>on the order of a .01% idiot factor. Is Amateur Radio a perfect world? No,

I have been a radio amateur since I was a teenager, back in '66, and in
my opinion amateur radio has never been healthier. The no-code license
has proven to be a fabulous vehicle for bringing new people into the
hobby. The new licensees have proven to be every bit as good as those
from any other era of the hobby (in my opinion) and many many of these
new ops quickly are upgrading to general, advanced, and extra.

The hobby is full of really great folks. The 1% who behave childishly?
Well, what the heck, there aren't many of them, and it's only a hobby?
We all have vfos, nowadays. :-) :-)

: calls frequently, but when I do a speaker-mike makes life so much easier.
: 73 Greg KD6QPY

Hi Greg, Be sure to get a speaker mike that has a stereo connection on
the mike connection because if you don't, you'll run your battery down
pretty fast discharging it through a 100 ohm resistor. The stereo mike
plug is used on Alinco and Icoms to deliver power to their VOX headsets.
DO NOT BUY A SPEAKER MIKE FOR THE 580 THAT HAS A MONO PLUG ON THE MIKE!
I have the newer model MFJ-284 for my 580 and I am very happy with it.

Subject: KENWOOD TH-28A VHF/UHF
To: info-hams@ucsd.edu

I use a Kenwood TH-28A here to great effect ! It comes with a receive
only feature on UHF that fits the bill nicely. My query relates to
programming the actual coverage via the internal diode matrix.
Presently the set covers 136- 174 MHz & 400 - 520 MHz (Rx only)
It seems (via a friendly dealer here in NZ) that shifting around the 8
tiny diodes on 1 PCB will alter actual coverage .... I'm keen to extend
down to 118 MHz VHF to receive aircraft band, but don't want to lose the
great UHF spread ! Perhaps some one has the full service manual out
there ? HAS ANY ONE HAD EXPERIENCE WITH THIS MOD ? THE ACTUAL SMD DIODES
ARE SO TINY THAT MY SOLDERING IRON WILL HAVE TO BE FILED TO A PIN !!
Thanks in anticipation ..... 73 de Zl2AJZ

Subject: Yaesu FT990 mailing list anyone?
To: info-hams@ucsd.edu

I've started a mailing list for Yaesu FT990 owners. If you'd like to
subscribe, send a message to 990-request@xyzoom.info.com stating your
wish. There are only about 6 subscribers so far, and volume is very
low, but perhaps it could be useful (in fact I appreciate low-volume
mailing lists better than the other kind). The address for the list
is 990@xyzoom.info.com.

2510. Re: FCC licensing delays

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-22 11:47:04 UTC
From: sct@po.cwru.edu
Message-ID: <2rngno$qv5@usenet.INS.CWRU.Edu>
Source record: 266566
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc

At least it isn't like The Bad Old Days, when the _exams_ were only once every three months. :-)

The FCC took 12 weeks to get me my last license. They have in recent memory been as fast as 7 weeks, but that didn't last long. It takes time, and one should simply accept that and be patient. Use the time to buy a copy of the ARRL Handbook or Operating Guide and read it, or buy a receiver and start working on your Morse Code. Just think of the boasting power you will have if you can upgrade to General or Advanced before your first license arrives!

In other words, yes, it's a bother to wait, but don't sweat it. The wait is not known to be fatal. If you want to get involved in ham radio Right Now (and what new ham doesn't want that?), buy books and read them and buy a receiver and listen. You'll learn a lot and be much more ready to start participating when that license arrives.

Because this has zilch to do with homebrewing, please send any followups to rec.radio.amateur.misc. Thanks.

>The thing that turns my crank is when someone identifies themself
>by giving their call and then they say "for I D ".
>
>Of course! that's what their doing isn't it?

In that case, yes, however there are other reasons to say your callsign. It's the standard way to join most repeater conversations, just insert your callsign in a pause. It's also a common way to insert an out of rotation comment, insert callsign, then wait to be recognized. So, if you're in a *large* roundtable, and 10 minutes has passed since your last ID, you might insert your callsign "for ID" at a pause. That tells everyone that you're not asking to break rotation, just stay legal.

On my repeater, we don't honor rotation, but we often do have stations riding along silently for periods in excess of 10 minutes while the conversation rages. So they may insert their callsign "for ID" in a pause for the same reason as in a roundtable.

>Why do they have to be redundant? I never heard this proceedure
>used in the 60's. Is this something that was carried over from
>the "Chicken Band" when they where required to use a call?

I heard it frequently in the 60s, but never on CB. Different areas have different repeater operating habits. "For ID" is one that's been widespread around here for a very long time, and for reason. On the other hand, calling "break" on local repeaters will get you heckled unmercifully.

>When ever I here some one do it I ask if they operated a CB
>radio before they where a Ham and usually the answer is yes.

Ask anyone licensed since the mid-70s if they operated CB and the answer is likely yes. I even bought a CB in the seventies, though I'd been a ham since the early 60s. CB has it's uses.

Unfortunately, most of the time I hear "for ID" is when two people are
chatting with one another. Clearly in this case its redundant, since why
else would you be giving your callsign if you're in the middle of a
conversation with someone?

> meter band has become sort of a novice testing ground. Some stay as no-code
> techs, others fall by the way side and drop out of the hobby, while
> yet others realize that there is more to ham radio than rag chewing on
> a repeater.

I don't deny this. Usually, most people in this area move off of 2 meters
because of the cesspool it is becoming.

> Stating that your problems have been with CBers coming into the hobby is
> taking the easy way out. At one time, I would guess that 50% of the adult
> population in the United States owned a CB (my guess only).

A few weeks ago, a new no-code tech came on to the largest 2 meter
repeater in the state, and started talking about how much he loved ham
radio, and now he has his 2 meter radio next to his CB in the truck. He
asked if anyone on the channel wanted a smokey report.

Its not a question of whether or not someone used a CB radio before in
their lifetime. Most hams today have probably had some form of experience
with CB radio. That's not the point. The point is whether or not someone
comes into the ham hobby after being indoctrinated into the CB radio
culture and brings all of his/her habits/ethics/morals with him/her.

The "yahoo" who I spoke of two paragraphs ago was one such example.
However, much to his credit, he spent a great deal of time listening and
learning from other ham operators. Today, he has improved his operating
practices dramatically, and for that, I give him credit.

> I think the
> real problem is that we are overloading the front end. The VHF repeaters
> are becoming congested.

And now the equipment manufacturers, tired of small profits from selling
VHF/UHF equipment, are looking to get the code requirement dropped to 10wpm
so more people can get HF voice privs and buy their higher-margin radios.

SB SAT @ AMSAT $ANS-140.01
AMSAT-NA COMMENTS TO NTIA

HR AMSAT NEWS SERVICE BULLETIN 140.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 21, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-140.01

AMSAT-NA Sends Comments To the National Telecomunications & Information Administration (NTIA)

The Radio Amateur Satellite Corporation has responded to proposals contained in a notice from the National Telecommunications and Information Administration (NTIA). That notice, entitled Preliminary Spectrum Reallocation Report, was released in February and was prepared pursuant to Title VI of the Omnibus Budget Reconciliation Act of 1993. In that Act, Congress mandated that the U.S. Government re-allocate to the private sector 200 MHz of spectrum below 5 GHz, 100 MHz of it below 3 GHz. Since Amateur Radio's use of the microwave bands is on a secondary basis to Government applications, mostly military, this proceeding could have a significant impact on our future access to these frequencies.

In its comments filed May 11 by AMSAT-NA VP for Government Liaison Perry Klein (W3PK), AMSAT-NA asked the NTIA for wider amateur and amateur-satellite service bands at 13cm than proposed in its Preliminary Report. It proposed that 2300 to 2310, 2390 to 2400 and 2402 to 2417 MHz be turned over to FCC for allocation to commercial users. In omitting 2400 to 2402 MHz from this re-allocation, NTIA noted amateur satellite use of this band. This would presumably leave 2400 to 2402 and 2417 to 245 MHz available to amateurs. The present 13cm amateur band consists of 2300-2310 and 2390-2450 MHz.

AMSAT-NA proposed a primary amateur/amateur satellite allocation of 2400-2410 MHz plus access to as much of the 2410 to 2450 MHz band as possible on a shared basis. In support of this request, AMSAT-NA cited the likelihood of greatly increased demand for amateur satellite operations in the 13 cm band in coming years, far more than can be accommodated within 2400-2402 MHz; the unsuitability of 2417-2450 MHz for amateur satellite downlinks because of interference from such devices as microwave ovens; and the need to coordinate amateur-satellite allocations internationally so that they are available on a global basis. In addition, AMSAT-NA proposed that a narrow band of 1-2 MHz, somewhere between 2300 and 2400 MHz, be allocated to the amateur service on a primary basis to accommodate the experimental weak-signal tropo and EME work now carried out around 2304 MHz.

AMSAT-NA comments were prepared by a group consisting of Perry Klein (W3PK), Ray Soifer (W2RS), Jan King (W3GEY) and Bill Tynan (W3XO).

SB SAT @ AMSAT $ANS-140.02
LO-19 & IO-26 OBC'S CRASH

HR AMSAT NEWS SERVICE BULLETIN 140.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 21, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-140.02

LO-19's & IO-26's On-board Computers Crash After A Single Event Upset (SEU)

It has been reported this week that LUSAT-OSCAR-19's On-Board Computer (OBC) had "crashed" after having experienced what is known in the aerospace industry as a Single Event Upset (SEU). This phenomenon is caused by high energy particles in space "effecting" changes in the "state" inside of memory chips and/or other electronic components. In simple terms, an SEU will change a bit from a "1" to a "0" or visa-versa in Random Access Memory (RAM) chips. All MICROSATs have software specifically desgined to handle this problem. However, this software is not "bullet-proof." The software can only correct one "state" change at a time. If two "state" changes occur simultaneously, there is a good possibility that they will occur in RAM memory locations that will eventually lead to an OBC "crash."

The problem with LO-19 was first noticed on 16-MAY-94 over Argentina when LU1JBR was working it then he noticed suddenly that the satellite simply "disappeared." On the evening of 17-MAY-94, LO-19's ground command station, operated by Norberto Pennini (LU8DYF) was able to successfully reset the OBC. AMSAT-LU ground station LU8DYF requests that all users of LO-19 to PLEASE REFRAIN FROM USING IT FOR SEVERAL WEEKS! The reloading of the software will take several weeks along with extensive tests to be performed to insure all is working properly. AMSAT-LU requests that if anyone was collecting telemetry between 17-MAY-94 at 02:00 UTC until 18-MAY-94 around 02:00 UTC that they please forward it to the following addresses: via packet radio to LU8DYF @ LU8DYF.BA.ARG.SOAM and/or LU8DYF @ ON ANY ACTIVE SATELLITE, or via Internet to: lu8dyf@asarin.org.ar. This will certainly assist in the recovery efforts by helping the AMSAT-LU group understand this crash. All users are asked to please be patient as the AMSAT-LU ground command team reloads the operating system software for LO-19.

Alberto Zagni (I2KBD) also reports that the the same high energy eruption that caused the LO-19's OBC to "crash" has also cause IO-26's OBC to "crash." I2KBD reports that the problem occured about the same time period and feels that this was due to the fact the Sun was spewing out alot of highly charged particles. I2KBD says that it will take several days to get the "kernal" and Integrated Housekeeping Tasks (IHT) software reloaded. He too asks that all IO-26 users to please be patient as they bring IO-26 back

"on-line."

Please stay tunned to the AMSAT News Service (ANS) bulletins for further status on the reloading and recovery of LO-19 and IO-26.

[The AMSAT News Service (ANS) would like to thank LU2DTZ, LU8DYF, and I2KBD for the information which went into this bulletin item.]

2518. "for ID"

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-22 17:49:36 UTC
From: oo7@astro.as.utexas.edu
Message-ID: <2ro5vg$k89@geraldo.cc.utexas.edu>
Source record: 266573

gary@ke4zv.atl.ga.us (Gary Coffman) says:

>if you're in a *large* roundtable, and 10 minutes has passed since
>your last ID, you might insert your callsign "for ID" at a pause.
>That tells everyone that you're not asking to break rotation, just
>stay legal.

Are you saying that even if you haven't transmitted a thing for
10 minutes, you still have to identify? If I finish a QSO, give
my callsign, the other guy says "bye" and I say "bye" (or "dit dit")
without an identification, do I have to make a special broadcast
within the next 10 minutes just to give my callsign? In the case
cited above, why isn't it enough to identify the next time you actually
make a transmission as part of the ongoing discussion?

Anyway, I hear this "for ID" thing at the start and end of monologues
on HF phone sometimes, which doesn't seem appropriate. Yesterday I
heard someone calling CQ DX on phone and then giving his callsign as
"Kilo Bravo Region Three ... ... ", which only seems to confuse
things (if I were straining to hear the call of a very weak station
and it seemed to have three letters before the number I think I would
be confused and probably give up).

And while I'm at it, what is the purpose of those CQ DX calls that
say "beaming the Pacific" - not "CQ Pacific", but "CQ DX, beaming
the Pacific"? Is this to indicate that you don't want to be called
by someone in Nepal? Or is it so that someone in the Pacific who
hears you only marginally won't respond because they know you can't
increase your signal any more by turning your beam? In either case,
it would seem to reduce the number of potential callers. Come to
think of it, most of the people who say they are beaming the whatever
rarely seem to get answers anyway.

It might make communications much easier if we just said what we
meant all the time, which means proper phonetics and procedures.
The cute stuff is OK when you know you are S9+, I suppose.

From: nu7i@indirect.com
Message-ID: <2ro8ib$elf@herald.indirect.com>
Source record: 266493

I heard of a person who had terminal cancer but went and passed the test
for a ham license. They asked the FCC for a special callsign for the
person to operate due to their short life expectancy. I think there was
not an affirmative response and the person died a few days before the
license arrived in the mail. This is a terrible example of the amount of
time required. Something sure needs to be done about this.
The problem is that, in today's commercialized society, the big whigs
don't consider ham radio to be that important anymore.

While perhaps his nomenclature and speech was poor (akin to CB), is this
anything truly wrong with letting fellow hams know of an impending radar trap?
I have done this (though usually on the Interstate in a QSO with someone I knew
was behind me) and don't see a thing wrong with it.

Could this be another one of the (MANY) things Mikey doesn't like?

I recently added a couple of TAPR Elmers (with information about
their "official" customer service and file server addresses) to the
Amateur Radio Elmers Resource Directory, which was posted to this newsgroup
(among others) on May 1st. If it's already expired at your site, finger
pschleck@unomaha.edu or write to elmers-request@unomaha.edu to find out
how to obtain the latest copy of the directory.

: When did the electronics pros and academia have the battle over "Hertz" vs
: "Cycles per second"? the late 1960s? (that seems right - i don't have
: access to the IEEE publications of that era right now and it seems like it
: settled out around that time [Siemens for "mho" also has occured as well..])

Well - you might become a little annoyed by this Hz vs. Cycles
matter... IMHO meters vs. feet topic is much more interesting. I believe
deep in my heart that feet/yard/miles (as well as seconds/minutes/hours)
is a complete braindamage and should be reformed. Anyway - it's very
annoying to answer questions like in the HAM exams - how many
feet is 28.5Mhz etc. I know that wavelength in meters is 300/MHz - and
that's enough...
Well - wiht the advance of comuputers humanitiy will probably never
get rid of some junky stuff... :-(
Vassili,
N2WID.

As the maintainer of the "Elmers list" for this newsgroup (among others),
I too would be interested in this information. I know several people
who have AMSAT E-mail addresses, one or two being on the Elmers list
(such as Bob Carpenter, W3OTC), but don't have any official customer
service contacts for membership information, files, or mailing lists.

If you wish to submit information about AMSAT, or find out more about
the Elmers list and how to obtain a current copy of it, please finger
pschleck@unomaha.edu or send E-mail to elmers-request@unomaha.edu.

On a related subject, something that the moderator of rec.radio.info
(Mark Salyzyn, VE6MGS) and I are very interested in is who is relaying the
AMSAT-related bulletins like the Orbital Elements and Space News to the
Info-Hams@ucsd.edu gateway. What is currently happening is that their
respective maintainers are submitting them to Mark who cross-posts them
to rec.radio.amateur.space and rec.radio.info (which causes them to be
relayed to the Ham-Space and Radio-Info mailing lists), then they appear
on Info-Hams (rec.radio.amateur.misc). E-mail to the maintainers
reveals that they are not the ones doing the duplicate posting, a person
or persons unknown within AMSAT is.

It's certainly not our place to dictate how bulletins should be posted,
or even who should post them, but if they are going to posted to several
newsgroups, a simultaneous cross-post is most desirable (propagating a
single article within news that will appear in most modern newsreaders
only once, although it will be duplicated on the mailing lists). Also,
if there will be multiple submitters to news of bulletins with packet-radio
BID's, they should use the Message-ID encapsulation convention like the
following:

SB BID$NNN @ DISTRIBUTION

becomes:

Message-ID: <bid$nnn.1994@ampr.org>

In this way any one news site will have only one copy of the bulletin, regardless of how many submitters post it.

Mark is perfectly willing to help anyone manage the complexity in properly formatting their bulletins. This could be as simple as mailing it to a different E-mail address (rec-radio-info@ve6mgs.ampr.ab.ca instead of Info-Hams@ucsd.edu).

While rec.radio.amateur.space (and Ham-Space) is really the most appropriate target for these bulletins (based on their charters agreed to by a vote of the readership at the last newsgroup reorganization), in the interest of cooperation, we would be amenable to simultaneously cross-posting the AMSAT-related bulletins to rec.radio.info, r.r.a.space, *and* r.r.a.misc (as it's still only one article being propagated) if there is still a strong desire to relay these bulletins to their "traditional" mailing list (we realize that some of the conventions and procedures for relaying radio bulletins predate the rec.radio.info newsgroup and not everyone is going to adopt our recommended techniques overnight, if at all).

Mark and I would very much like to hear from individuals within AMSAT who are interested in using the net to publicize their organization and distribute their bulletins in the most invisible and bandwidth-efficient ways possible. An excellent forum for discussing some of these issues with Mark, myself, and about a dozen other experienced radio information maintainers on the Internet is the rec.radio.amateur Working Group mailing list (rra-wg). To subscribe, send E-mail to rra-wg-request@amdahl.com.

Cross-posted to: rec.radio.amateur.misc,rec.radio.info

SB DX @ ALLBBS $OPDX.159
Ohio/Penn DX Bulletin No. 159

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 159
BID: $OPDX.158
May 23, 1994
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, AD1C, NX1L, WB3JFS, WA4WTG, K8PXG and AH0W/OH2LVG for the following DX information.

4K2 & R1, FRANZ JOSEF LAND. 4K2BY, 4K2MAL, R1FJL and R1FJC have all been active this past week (mostly on 20 meters CW between 2130 and 0300z). R1FJC has shown up on 14247 DX Net around 2145z. 4K2MAL has been heard on 18078 kHz at 2020z.

5W, WESTERN SAMOA. Cliff, 5W1GC has been active on 7001 kHz from 0830 to 1115z. If he is not on 40 meters, he can sometimes be heard around 10103 kHz during the same time frame. Also check 18070 kHz at 0145z and 14218 kHz begining around 0330z.

9U, BURUNDI. On May 21st, there was a station signing 9U/F5FHI on 21286 kHz at 1745z. There is not much information on this station other than to QSL to the CBA (BTW, it was not in the callbook.) WFWL! This is great news, if this operation is legit. Last operation from here was during 1993 on October 15-16th, by DJ6SI and crew. Several days after their operation went QRT, there was a military coup in Burundi. Hopefully, 9U/F5FHI is a good sign that amateur radio can still be active in 9U-land.

AP, PAKISTAN. AP2JZB was heard on 21299 kHz at 1636z. From the W6GO/K6HHD QSL Manager List: QSL via K2EWB. K2EWB sends cards to him and receives them from him. Send SASE and 2 IRCs or one green stamp.

C6, BAHAMAS. Mitch, KH6M, will be operating from Abaco Island in the Bahama Islands. Mitch will be using the call C6AHY and will be operating on all bands 160 thru 10 meters. Mitch's primary purpose is to operate in the CQ WW WPX CW Contest. There will be no WARC band operating until after the contest. Mitch will arrive on May 26th and will be operating from a big station with big antennas. His length of stay is unknown at this time. QSLs should go to WA4WTG.

EP, IRAN. A station signing EP2DL was heard on 14151 kHz around 0045z. Also, EP2ASZ has been heard a couple of times this month on 20 meters CW around 2200z.

FO0/A/M, AUSTRALES AND MARQUESAS ISLANDS. A fax received from Nao, NX1L, announced that Kan, JA1HGY, and himself will be going on a DXpedition to these two new prospective DXCC countries. Both operators feel these two islands fit the DXCC Criteria under Points 3(a) and 3(c). They plan to file a petition with the DXAC for new-country consideration after their trip.
Kan will operate first from Rurutu Island of the Australes group from May 28-30. His call sign will probably be FO0MIZ/A. Then Kan will go to Nuku Hiva Island of the Marquesas group where he expects to sign FO0MIZ/M from June 1-11. Nao will be accompanying him during the first 9 days. His call sign will be FO0AKI/M. Activity from both locations will be on 80 through 10 meters, using CW and SSB in usual DX windows. The QSL information is as follows: FO0MIZ/A & FO0MIZ/M via JA1HGY, and FO0AKI/M via NX1L. Their addresses are:
Nao Mashita, JA1HGY Nao Akiyama, NX1L
8-2-4 Akasaka P.O. Box 310855
Minato, Tokyo 107 Newington, CT 06131-0855
Japan U.S.A.

EDITOR'S COMMENTS: The DXAC in 1989-90's examined and voted against DXCC status for these two islands. The main reason for the "NO" vote is that the Committee felt French Polynesia was not a Point 1 country.

HL, SOUTH KOREA. This past week there has been plenty of active on 20 and 40 meters by HL stations. HL9DC was heard on 7005 kHz between 1030 to 1200z. Lee, HL5AWS, can be found between 14180 and 14205 kHz around the times of 0745, 1115 and 1415z. Harry, HL9HH, has been showing up on the 14226.5 DX Net as early as 2315z. HL3IWD was heard on 14018 kHz between 1100 and 1200z.

IOTA NA-138. The Clay County DX Association will be operating on Amelia Island from the Fort Clinch State Park. Operations will begin June 2nd, 2100z, thru June 4th, 2200z. Using the callsign KQ4GC, look for stations on 80-10 meters CW/SSB. A photo QSL will be available by QSLing to: KQ4GC, 4094 Sandy Run Dr., Middleburg, FL 32068.

J8, ST. VINCENT. Well known DXer Rudi, DK7PE, is now active, but there are no details available on how long he will be here. Look for Rudi signing J8/AH0G on all bands (including the WARC bands) and working mostly CW. QSL via DK7PE.

OH0, ALAND ISLAND. A contest team from the Helsinki area will be activating Aland/Ahvenanmaa in the CQ WW WPX CW Contest as an all band effort signing OH0AAQ. The team will also be active on the WARC bands before and after the contest. Operators will include OH2BCI, OH2BVF, OH2MAN and OH2NRV (who will also act as QSL Manager).

TN, CONGO. Joe, DF1AL, who was recently active from 3A-land, announced that he and others are planning a DXpedition to the Congo from February

27, 1995 thru April 6, 1995. They will operate on all bands including the WARC bands and the satellites. Meanwhile, there was a rare appearance by TN1AT on a DX net May 18th on 14247 kHz at 2130z.

XX, MACAO. XX9GD was heard on 50135 kHz at 0154z and 3799 kHz at 1204z. Also, XX9AW was heard on 14200 kHz at 1345z. QSL XX9GD to: Antonio A. P. B. Costa, Box 1476, Macao. QSL XX9AW via KU9C (92 CB or later).

ZD8, ASCENSION ISLAND. By the time you read this, Jim, N6TJ, will be active again from here until June 2. Jim will be active in the CQ WW WPX CW Contest, but before the contest he plans to be very active on 160 meters. QSL via VE3HO.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and the FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as KB8NW/OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 22/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 22 MAY AND FORECAST UP TO 25 MAY

IPS Warning 14 was issued on 21 May and is current for
interval May 24-25.

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 085/027

1B. SOLAR FORECAST
23 May 24 May 25 May
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 084/026

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet

Estimated Indices : A K Observed A Index 21 May
Learmonth 07 2222 2222
Fredericksburg 05 05
Planetary 10 07

Observed Kp for 21 May: 2212 2222

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
23 May 10 Quiet to unsettled.
24 May 18 Active.
25 May 18 Active.

2C. MAGNETIC COMMENT
A coronal hole is expected to raise geomagnetic activity to
active levels during 24-25th.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
22 May normal fair fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
23 May normal normal fair
24 May normal fair poor
25 May normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
Degraded HF comms expected at mid and high lats May 24-25.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were slightly above predicted monthly values

Observed T index for 22 May: 39

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
23 May 40 Near predicted monthly values.
24 May 30 Near predicted monthly values.
25 May 30 Near predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
Strong spread F observed during local night, and is again expected during local night tonight. Degraded comms conditions are expected during the interval May 24-25 due to expected coronal hole sourced activity.

: > hobby.

: I'm glad that amateur radio in your area is healthy. In this area its
: in poor health, slowly approaching what amateur radio has become in
: southern california. Most of the problems have been with CBers coming
: into the hobby and bringing their bad habits with them. 90% of the
: callsigns I hear on local 2 meter repeaters are N1xxx no-code calls.
: The elmers have fled to the safety of private repeaters or other bands.

Here in Southern Cal, amateur radio is in great shape. We have very few lids on 2 meters, and we don't have a lot of cb-type operating. Don't know what it's like where you are, but I'd appreciate it if you didn't defame us southern Cal types. Courtesy and friendliness is what characterizes amateur radio here.

Sorry to hear that things aren't as good where you are as they are here in Southern Cal.

: Controls Division email: blifter@ccd.harris.com
: -.. . -.- .-. ....- .- --.- de KR4AQ

Let's plese get it straight. Amateur radio here in Southern Cal has
nothing to do with CBers getting on the bands. Not sure what it is like
where you are.

>>stay legal.
>
>Are you saying that even if you haven't transmitted a thing for
>10 minutes, you still have to identify?

Gary's pointing out one context in which it could make sense to
say "for ID," but he's not saying that you have to break in to
say your call.

If you're in a big roundtable, or a net, it makes sense to say
your call at the end of each transmission so that you don't have
to worry about what happens in 10 minutes. If, say, the power
goes off, or if you have a heart attack, you can concentrate on
your other problems and not worry about a pink slip.

RB> all the elmers fleeing to the private repeaters, rubbish. We have as
RB> nice a cross section of hams on 2 meters as you could ask for, and
RB> virtually all of the repeaters on 2M are characterized by courteous,
RB> excellent operating practices. Incidentally, scores and scores of the

I agree. It's a shame that a few repeaters such as .435 and 5.22
are giving people that impression.

RB> Over 90 percent of repeaters in Southern Cal are closed to virtually
RB> all hams, and this IS unwholesome. Eventually we will do something
RB> about it, however.

Well, that depends on where you look. The vast majority of the 2M
band is open, but the opposite is true of 440. 220 is (for the most
part) still open as well. I think the 220 band is radio's best
kept secret, at least from my location. There are plenty of free
repeaters that aren't packed. The only bad thing I can see in
Southern California (except for 440 being closed) is the amount of
people on the same repeaters at the same time. This really limits
the opportunities of having a quality QSO. One time I was driving
through the Valley and I felt like an air traffic controller trying
to get a signal report as fast as I could before someone else made
a call. They either need to open up 440 or put more repeaters on 2M,
because things aren't going to get any better...

SL> What about it makes it "unwholesome"? Do these "closed" repeaters
SL> also suffer the same or higher level of jamming, obscene/foul language,
SL> etc. that the more "wholesome" open repeaters have?

I think the problem with closed repeaters is the lack of opportunity.
I believe that I should have the same right as anyone else to use
a frequency.

SL> So, would it be better if there were FEWER total repeaters and more
SL> simplex channels or, should we have more repeaters and make all of
SL> them "open", or what?

I vote for the latter. Everything is becoming too crowded these days.
Open up the 440 band and relieve some of the congestion on 2M.

... Catch the Blue Wave!

2536. 610 Form in PostScript(r)

Actually, wouldn't it be cheaper to just order up a bunch of forms from the government (I do when I need to)? And you would tend to avoid getting old forms stored away that way.

Xerox "buff" paper seems to be real close to the FCC paper color (goldenrod looks to be too "orange" to my eyes). Had to get some copies made in the early days of the forms, they've been used, so far no rejects. (helps to have a good copier that doesn't "see" the paper color that would add noise to the copies -- gotta love those 5100's).

There seems to be some variability in the paper color anyway based on what people bring with them to exams. Some are pretty yellow while others are paler.

Probably as long as it's close it will be OK. the normal response from the FCC would probably be a copy of one of their 610's with a letter saying something like "use the Right Form this time Young Man!" and your form back.

Notes of Interest.

Correction: QSL manager for TU4EI listed in last week's bulletin should be W3HCW, not W2HCW.

Micronesia, V6. A group from OKDXA and the Pacific are planning for a one week operation, 9 June from Pohnpei. They will have four stations, mostly CW and RTTY on all bands including the WARC bands. QSL OKDXA, P.O. Box 88, Welston, OK 74881 USA.

Bhutan, A5. Word is out that Jim Smith, VK9NS is waiting for the final word from the Ministry of Communications and would be off and running. He might also operate from Bangladesh and Nepal on the way to Bhutan. Please Jim, some RTTY activity.

Crete, SV9. HA6NY plans to be active on RTTY 24-31 May.

Mariana Island, KH0. JA6VTZ and JF6BCC plan to operate 10 thru 160, RTTY included. Callsigns respectively, AH0T and KH2GR/KH0 from 26-30 May.

For next week's Bulletin, send your Bandpass and Notes of Interest to Jules, W2JGR @ W2TKU.#SRQ.FL.USA.NA

: James Proctor (proctor@news-reader.nist.gov) wrote:
: : I have a problem with my RS HTX-202 which I think is related to the
: : power save feature. I set the time-slice for the power saver to 1/4 sec
: : and turned on "SAVE". Since then, quite often, the receiver will turn on
: : right in the middle of an ongoing qso. This happens even while listening
: : to a local repeater which is S9+30 and the squelch is set just above the
: : background noise (even an S1 signal will open the squelch). This has also
: : happened while I was operating simplex. It appears that the receiver does
: : not always "wake up" when a signal is present.

: Since I read your message, I tried it out myself. I think I may have
: the only one that does not have your problem. I tested it by having
: two radios tuned to the local repeater. The 202 and another w/o power
: save. I first tried the 1:2 setting. I noticed the very brief delay
: between the non-power saved HT and the power saved 202. I then tried
: the 1:4 setting. I noted the 1/4 second delay but not the several
: seconds' delay you describe. I'll do more testing and see if it
: happens to me on which power save setting.

Is the "wake-up" signal to the power-saver circuitry in the HTX-202 derived
from the audio, or does it come from the RF/IF sections in the radio?

I don't own this radio, nor do I have access to one, but now I'm wondering...

Successful news cast from Wireless Hill in W.A.

Our congratulations to W.A.A.D.C.A. for the success of the
RTTY news cast from Wireless Hill in Perth. It is pleasing to
hear that the coverage is so wide with excellent copy received
all over the metropolitan area. It is indeed an excellent site
and the Perth amateurs should get good value from any and all
services provided from there. That is what you can get when
people are prepared to work and do something to help fellow
amateurs in the hobby. Again, our heartiest congratulations
for a job well done.

We also hear of the social side of the hobby in Perth, with
the regular lunchtime get-together of the Old Timers group. Be
nice if we had that here in New South Wales. As far as I know,
not being an Old Timer, is that it is a case of bring your
sandwiches to Amateur Radio House, not meet at a place with a
good meal. Of course, the socialising will be similar but the
venue could be a great deal better, hi hi.

Thanks to Clem VK6CW for the above information

Now we have our contest coming up shortly, so we will begin to
publish the rules this week. You are going to participate, are
you not ??

ANARTS WW RTTY/Digital DX Contest Part 1

Contest period: from 0000Z Saturday to 0000Z Monday (48 hours)

Maximum operating time allowed: 30 hours for Single op entries and SWLs.There are no restrictions on the duration of rest periods. Multi-op stations may operate the entire contest period. Summary of operating times must be submitted with each score.

Bands: 80, 40, 20, 15, and 10M. (five bands).

Classes: (A) Single-op; (B) Multi-op; and (C) SWL.

Modes: All digital modes permitted. RTTY, AMTOR, FEC, Packet, Pactor, Clover, G-TOR.

Exchange: RST plus Zone plus Time (UTC)
(More next week)

For amateurs in the eastern states, here are two Field days coming up, one on ANARTS Contest weekend, and another in August. If you are planning a holiday, why not think about attending one of these days and perhaps meeting the authors of signals from your radio.

1994 PORT MACQUARIE FIELD DAY

It's on again, one of the friendliest Field Days you can attend and here are the details:

Date: Saturday 11 & Sunday 12 June

Venue: New Scout Hall on Buller Street next to Westport Bowling Club, on the water front. Near the centre of town and the Settlement shopping area.

Programme: Saturday June 11

3pm doors open for pre-registration, there will be no displays or exhibits

4pm 2 metre fox hunt trial so that visitors can get to know the area

6pm roast dinner at the venue so everyone can talk about the happenings over the past year

Sunday June 12

8am set up exhibits, stalls etc

9am OPEN DOORS!

10am first fox hunt

During the day there will be 4 fox hunts (2m,10m,40m and pedestrian 2m)

All major disposals must be in place before 9am. There will be a mid-day BBQ and refreshments available throughout the day.

There will be the usual raffle and prizes for the most number of contacts made on the 2m repeater (146.7) en-route. Maps, pre-registration and information can be obtained from the Hon. Secretary on (065)852647 or leave a message on VK2ATM-1 PBBS for VK2AYD.

We look forward to seeing you all again this year.

73 David Pilley VK2AYD

and later in the year ...

RIVERINA FIELD DAY

The Twin Cities Radio and Electronics Club is hosting the 1994 Riverina Field Day in Albury on the 13th August .

The location is the Murray High School, Kaitlers Road Albury. Doors open at 9.00 am. There will be exhibits by various suppliers of nice NEW gadgets as well as the opportunity to obtain that coveted pre-loved special. An invitation is extended to all amateurs living in VK1,VK2 and VK3 and especially to those amateurs who may be visiting our fair cities at that time. Keep checking your local BBS for future updates.

IPS weekly report
---
13 May - 19 May 1994
Issue No 20
Date of issue: 20 May 1994
INDICES:
Date 13 14 15 16 17 18 19
10cm 089 090 091 091 095 094 091
A 08 19 28 26 14 20 (16 estimated)
T 23 36 45 33 41 48 48

SUMMARY OF ACTIVITY

Solar activity was low on 14th, and very low for the remainder of the period.

The geomagnetic field at Learmonth (WA) was quiet to unsettled 13th-14th, and 17th-19th May. The field was unsettled to active 15th-16th, with minor storm levels at times on 15th.

Ionospheric F2 critical frequencies at Sydney were mostly near predicted values. Enhanced periods of up to 50 per cent were

observed on 14th-15th, and up to 30 per cent on 18th-19th May. Depressions of up to 30 per cent were observed on 14th-15th, and again on 18th-19th May. Spread F was noted on 16th-19th, and sporadic E may have degraded F layer communications on 16th.

FORECAST FOR THE NEXT WEEK (20 - 26 May)

SOLAR: Very low to low

GEOMAGNETIC: Quiet to unsettled.

IONOSPHERIC Near predicted monthly values to 20 per cent enhanced.

Courtesy of IPS Radio and Space Services

NOTES OF INTEREST:
ALBANIA ZA. ZDENO, OK2PZW WILL ACTIVE DURING THE CQWW WPX CW CONTEST MAY 28 AND 29. BEFORE THE CONTEST HE WILL BE ACTIVE AS ZA/OK2PZW ON CW/SSB AND RTTY ALL BANDS WITH ONLY 10 WATTS.

RARE RTTY ACTIVITY. FOR WHAT HAPPENS THIS WEEK IN THE YEMEN AREA WE LOST A CHANCE TO PUT THIS RARE ONE ACTIVE ON RTTY. WE BWERE TRYING TO SET UP DIGITAL ACTIVITY AS JACQUES, J28JJ HAD POSSIBILITY TO TRAVEL THERE. HOW LONG WE WILL HAVE TO WAIT NOW ?. IF HOPES FOR 7O ARE GONE AT THE PRESENT, OTHER COUNTRY ARE STILL WAITED TO RETURN ACTIVE ON RTTY. FOR EXAMPLE LYBIA, 5A LAST AND ONLY RTTY ACTIVITY FROM THERE WAS ON MAY 1965.

GUERNSEY GU. DC9KZ, DL9YAJ AND DL6ET WILL BE ACTIVE FOR ABOUT 3 WEEKS STARTING JUNE 1ST USING EACH CALL GU/. MODES INCLUDE ALSO RTTY. QSL CARDS VIA BUREAU TO THE HOMECALLS.

TONGA A35. LOOK FOR PAUL, KK6H WHICH IS ACTIVE FROM THE SHACK OF A35CT TILL JUNE 4.

P5RS7 UPDATE. THE ARRL RECEIVED FURTHER DOCUMENTATION FROM THE OPERATION. WHEN PAPERS WILL TRANSLATED FROM THE ORIGINAL LANGUAGE (KOREAN) WILL BEGIN THE INVESTIGATION.

SEND YOUR BANDPASS AND NOTES FOR NEXT WEEK'S BULLETIN TO BOB, WB2CJL AT W5KSI.#NOLA.LA.USA.NA OR TO I5FLN.ITA.EU.

GL DE (DX2) LUCIANO, I5FLN AT ZS5S.ZAF.AF

Please! How is this obstruction of justice? Obstruction of justice involves concealment or deception of an illegal activity - if I tell someone there is a radar trap ahead, I am telling them to AVOID performing said illegal act.

(Besides, aren't most radar traps an "obstruction of justice", in layman's terms?)

So if one is in a big roundtable conversation, one should play it safe by identifying every transmission he/she makes?

One of the locals here would ID _every_ transmission he made in even a two person conversation... Every single comment back and forth with someone would be followed by K6**. Every once in a while he would slip up, though. At least he didn't keep saying "for ID."

The 3-Hr Ap Indices for 21 MAY 94 are: 7 8 5 7 10 8 9 9
Greater than 2 MeV Electron Fluence for 22 MAY was: 6.8E+08

SYNOPSIS OF ACTIVITY

Solar activity continued at a very low level. Region 7722
(N08W66) was stable and Region 7727 (N09E01) decayed slightly.

Solar activity forecast: solar activity should continue
at a very low level for the duration of the forecast period.

The geomagnetic field was quiet at mid latitudes and quiet
to slightly unsettled at high latitudes. Energetic electron
fluxes continued at moderate to high levels.

Geophysical activity forecast: the geomagnetic field
should be mostly unsettled during the next three days due
to a coronal hole now located in the northwest quadrant of
the sun.

Event probabilities 23 may-25 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

>conversation with someone?

Yeah, that's redundant, just as saying "Guess it's about time to ID, this is Kxxxx" is more words than absolutely necessary. However, once you're in the habit of saying "for ID" in a repeater setting, it tends to be used all the time. No harm done as far as I can tell whether you do it one way or the other.

Gary

>cited above, why isn't it enough to identify the next time you actually
>make a transmission as part of the ongoing discussion?

The rules say you should ID every 10 minutes during a QSO. And it's a bad practice that impedes the natural flow of conversation to say your callsign at the end of *every* short transmission on a repeater. So it's often necessary to ID after being silent for a few minutes to stay legal. Since you haven't signed, you're still part of the QSO, and need to ID at 10 minute intervals. An often satisfactory alternative is for everyone to ID when the repeater does.

> something like "use the Right Form this time Young Man!" and your form back.

I checked on this last week. I picked up a xeroxed copy of the new 610 form from my local HRO, which was copied onto a light beige paper. I sent this thing in 10 weeks or so ago, and have yet to get a reply. After reading the discussion here, I was woried that the FCC circularly filed the thing because the color was wrong. So, I checked with our friends in Gettysburg (717/337-1511 fyi) and a customer service representative told me that the exact color wasn't all too important [though, I guess white is still out], as long as all the information was there. She also said that their current turn around time is 14 weeks... argh!

The easiest thing to do, it seems, is to order some forms from the government (in lots of 1000?) or from the ARRL. This way, there will be no color conflicts.... Or have the FCC change to a paper color avaialble at your local CopyMat, etc...

You don't give enough detail about your circuit to make a definite choice, but
I would be extremely inclined to use a low-end microcontroller here. Depending
on the device you select, you should easily be able to set up a
selectable delay accurate to anywhere from one microsecond to .1 millisecond.

For that matter, why not do the whole thing in a microcontroller?

: Over 90 percent of repeaters in Southern Cal are closed to virtually all
: hams, and this IS unwholesome. Eventually we will do something about it,
: however.

What about it makes it "unwholesome"? Do these "closed" repeaters also
suffer the same or higher level of jamming, obscene/foul language, etc.
that the more "wholesome" open repeaters have?
There is certainly nothing "illegal" about a closed repeater, right? Or,
has there been a new FCC (not ARRL) edict on this? I know we don't
"own" the airwaves, but there's nothingin the rules that I've read that
says that ALL repeaters are owned by the public.
So, would it be better if there were FEWER total repeaters and more
simplex channels or, should we have more repeaters and make all of them
"open", or what?

AND, out of curosity, just exactly who is the "we" that are going
to do something about the unwholesomeness of closed repeaters?
And just what and when would "we" do it?

73 de Sandy
WA6BXH - slay@netcom.com
PS: I don't live in California and have only very, very rarely used a
repeater - open or closed, during my own 30+ years as a ham; so I
admittedly don't know much about the problems which may exist there
and don't have much of an opinion - other than to ask what others
mean by theirs. ;-)

I don't know why anyone would say that Southern California amateur radio has been invaded by CBers. Nothing could be further from the truth. Southern California amateur radio has been invaded by ENTHUSIASTIC NEW HAMS virtually all of whom are FB ops! And as far as all the elmers fleeing to the private repeaters, rubbish. We have as nice a cross section of hams on 2 meters as you could ask for, and virtually all of the repeaters on 2M are characterized by courteous, excellent operating practices. Incidentally, scores and scores of the new no-code folks out here are upgrading to advanced and extra! FB! HF bands look out, new blood is on the way.

I've been a radio amateur since 1966, and I've never seen our hobby as healthy as it is now.

We have a few problem ops, and a few jammers. Mostly they congregate in one or two spots, and the rest of us ignore 'em.

What IS true, is that in Southern California, back when coordination of VHF/UHF was new, a bunch of old boys got themselves appointed as coordinators for 440. These chaps then assigned THEMSELVES virtually all of the 440 repeater pairs, which they proceeded to designate as closed or private. This has effectively shut the average ham out of the 440 band in Southern California, which is unfortunate.

Over 90 percent of repeaters in Southern Cal are closed to virtually all hams, and this IS unwholesome. Eventually we will do something about it, however.

The problem is the same it was when I got my ticket 17 years ago, a few bad ops stand out, the good ones are transparent. There have ALWAYS been trouble makers on the bands but as always, they eventually burn out and get replaced w/new ones...just turn the frequency dial and they disappear. The only problem w/some new ops is some of these folks can't even figure out how to measure the SWR on their antennas until it's too late; these few individuals have missed the point of the hobby...

>Actually, only the USA has not yet adopted the system accepted worldwide as
>the standard for DAB. (Mostly because of intense lobbying by commercial AM
>and FM broadcasters who see it as new competition in an already competitive
>market.)

Yes indeed, there may be other developped countries in the same
situation
but i don't know wich ones. The WARC (ITU) 1992 has officially adopted the
L
Band (1452-1492MHz) as the worldwide band for DAB radio. And the americans
don't want to use that band but prefer to continue to use MW and FM bands
for
DAB. Two main arguments for using this new band for DAB is the bandwith
available and the ability to receive also from satellites. Hence the actual
DAB standard is a data flow of 1.5 million bits/sec compressed to .25
million
bits/sec using a bandwith of 1.5MHz per stereo service (6 services per
channel). So, that standard is unapplicable to the MW band(0.01MHz bandwith)
and the FM band (0.25MHz). That's why americans must develop a different
standard. Acording to the Canadian plan all MW and FM broadcasters should
have migrated to the L band by 2010 sharing all the same audio quality and
extra services(too long to explain here).

Extracted from an Industrie Canada leaflet printed in 1993 is a view of
the american position on DAB. This was written by the work group on DAB
implantation, consisting of representants of broadcaters industries and
government.

" Why the USA does not adopt the L Band for DAB?

Actually the L band is not available for DAB in USA. Besides, many
american broadcasters are opposed to it's use because they
maintain that DAB in the L band is a menace for existing radio stations.
Acording to these broadcasters, the introduction of DAB radio stations
working on the L band would create a third band added to to MW and FM. The
stations operating in this new band, in wich audio quality would be
superior,
would grab some publicity revenues to traditional AM and FM stations who
already have difficulties to make profits in a saturated american market.
To overcome the menace posed by DAB broadcast in the L band some
american
companies and broadcasters are jointly working on a DAB standard that could

be operated in the MW and FM bands.
They have yet to proove that the proposed standard, known as IBOC
(intraband in the lane (my translation)) could be exploited satisfactorily
as
well in the MW and the FM band. We cannot dare say there is no solution in
this avenue, but many international experts doubt that this american
initiative can produce real improvements. Most countries want their future
digital services to be coming as well from earth based transmitters as
satellites. In view of the propagation caracteristics of the MW and FM bands
the IBOC system won't be usable by satellites.
The problem is that even if the IBOC system could work well in labs it
might not be so in real world. It might not overcome the problems of fading
and multipath linked to FM transmission. So it is unlikely that the IBOC
system's efficiency would surpass analog FM enough, specially in the case of
car reception.
For the MW band even with the reduced need in bandwith arising from data
compression the band isn't wide enough specially if you have to transmit as
well the traditional MW service along with IBOC services. Besides at night
there are serious jamming problems due to other stations that could cause an
important degradation of DAB broadcasts in this band.
Consequently it is likely that any feasable IBOC exploitation would be
in
the FM band to the detriment of MW stations. Then the actual inequalities
between MW and FM stations wich made havoc to MW stations exploitants in the
unregulated US radio market, would only increase if such a solution would be
retained.
IBOC cannot offer real improvements to broadcasters and listeners. And
obviously, if the listeners don't beleive taht DAB is realy superior they
will buy the radios. "

Actually some of the long term tests are going on here in Montreal. If i
could tune to 1468.75MHz i would hear the digital broadcast of 6 local
stations repeated on the same channel. 10 prototype receivers made by the
Eureka 147 consortium(Phillips, RCA-GE, Telefunken and Grundig) are in use
somewhere around the town. The first production models should appear in
1995.
Other companies: Pionner, Sony, Kenwood, and Delco have asked for licences.
It is expected Delco (a GM subsidiary) will be a big player in this field
since it is making half the worlds car radios, and the rate of renewals of
cars is quite high and the fact that 55% of radio listening is done in cars
make the car radio the major port of entry of DAB.

I would have said hardly any money ;).

But it's NOT an acronym. Repeat, NOT an acronym. Ham, hams, but not
HAM. The only HAM I know of is an obscure video mode on Amiga
computers.

Where did this wearisome idea that it has to be an acronym come from,
anyway? The theatre's had hams from time immemorial without getting
this strange idea into its' collective head!

>they on internet? How can I get Northern Ontario repeaters listed again?
>

The info in the ARRL repeater directory comes from the repeater
coordination groups or the repeater owners; if a group or owner doesn't
submit the info, the ARRL can't print it. That's probably why the
Northern Ontario info isn't in there.

To get them listed in the next edition, you have to get the folks who
coordinate or keep some type of list of repeaters in that area to send
the list to the ARRL. Or, the individual repeater owners have to
submit the info themselves, on the forms found in the back of the
repeater directory.

The CHP uses 42.xxx MHz. There are some frequencies for local gummint such as the AQMD there, but it's mostly U.S. Government frequencies. So there are some active frequencies. There are some old mobile telephone channels in th middle of 35MHz. Lifeguards are on the low end of 37MHz. I remember that the L.A. Sheriff's office used the high end of the 30's, up around 39MHz. But I think they've all gone to trunked systems on 800MHz. If you use the R/C in a large metro area, you can probably expect interference.

Anyone know the internet address of the FCC database for California? I telnetted into it once and used it, but I can't find the address. It'll let you search by frequency, licensee name, etc. I found out that there is a Marriot hotel on our frequecvy and it's just a few miles down the road. The people at work that have radios don't seem to complain, because their PL tones are different. But it's hard to monitor on a scanner.

I'm glad that amateur radio in your area is healthy. In this area its
in poor health, slowly approaching what amateur radio has become in
southern california. Most of the problems have been with CBers coming
into the hobby and bringing their bad habits with them. 90% of the
callsigns I hear on local 2 meter repeaters are N1xxx no-code calls.

The elmers have fled to the safety of private repeaters or other bands.

I think you are over generalizing a bit. The no-code technician license
has brought a wealth of future amateur operators. In my opinion, the 2
meter band has become sort of a novice testing ground. Some stay as no-code
techs, others fall by the way side and drop out of the hobby, while
yet others realize that there is more to ham radio than rag chewing on
a repeater. The last group ends up either upgrading and gets involved in
HF activities or stays on the VHF side of things and get into emergency,
packet, or whatever. This is quite evident by the recent growth in the
QRP clubs across the country.

Stating that your problems have been with CBers coming into the hobby is
taking the easy way out. At one time, I would guess that 50% of the adult
population in the United States owned a CB (my guess only). I think the
real problem is that we are overloading the front end. The VHF repeaters
are becoming congested. Have you ever been on a major highway when it has
become congested? It brings out the worst in people.

Hi Joe, take a look at the 580 schematic. On the stereo mike jack (JK603)
you have a 100 ohm resistor (R602) to 5v. When you use the RS speaker-mike,
you are wasting 50 mA. Of course, it works... it just runs your battery
down faster. If you're satisfied with that drain, that's fine. I just
wanted to warn everyone who has not bought a speaker-mike yet.

Subject: Loomis Invented Radio ?????
To: info-hams@ucsd.edu

Bob Keller writes:

>It's probably not historically accurate to attribute the _invention_ of
>radio to Marconi, but he seems to have been first out the blocks in terms
>of its commercial exploitation!

I agree. Others, most notably Tesla, preceeded Marconi. At the time Marconi
sent his single-letter message accross the Atlantic (no mean feat, to be
sure), Tesla was giving public, and well-documented, demonstrations of
radio-controlled model boats and submarines at Madison Square Garden, and in
the Hudson. Some of his models were powered entirely by the received radio
energy, including their propulsion motors. It is certainly true, however, that
Marconi was streets ahead of Tesla in the practical application of radio to
communications, much to the distress of Tesla's financial backers, who thought
they were paying for the development of a wireless telegraph system.

OK....

We think we might have the problem licked...maybe... I know a few folks
locally that were experiencing similar problems on Icom x8 series radios...
and they just did a software reset and it worked correctly...

Anyway, we did a reset on it (finally found it in the book...william swore
it was not in there... I found it plain as day...

Anyway, we did the reset and the rig is working fine...for now...it was
a nice cool night up here in Gainesville last night...so it might still
need some reworking... could indeed be a problem in the VHF pa.

Thanks for the help, though Gary...let's hope that it was indeed firmware
and not hardware (grin)/....

Also, thanks for the reply --- you the only one!

Subject: What does HAM mean ?
To: info-hams@ucsd.edu

Here's another possible source: Webster's defines a "ham"
actor as one who is considered incompetent. Since that term
applied to an actor may predate the invention of wireless (maybe
even by a couple of hundred years or more), it could be that
the term "ham" operator was applied as a DEROGATRY name by
professional wireless operators, especially in the days preceding

regulation and licensing after WWI, when amateurs were notorious
for cluttering up the spectrum and interfering with commercial
wireless. In other words, to the professional wireless operator
the amateur was the radio equivalent of a "ham" actor; i.e.,
basically incompetent.

Heck, get yourself a copy of the ARRL Maidenhead Grid maps for North
America. You'll find that North America ends at about latitude 51 N.
I pointed this out to some nice person at ARRL HQ and they sent me a
World Maidenhead locator, which did indeed cover my QTH (55N 113W).

This anecdote is symptomatic of a certain kind of USA-centric thinking
which I've come to associate with our good southern friends :). I've
got to point out in all fairness that they corrected their gaffe for
free.

Yes this problem appears to be inherent in all the HTX-202 radios.
I had it too and checked with R.S. to see if they had a service bulletin
out about it, but no luck (but this was over a year ago and they may
have admitted it since then). I thought about sending it back but it's
not important enough to me to lose the radio for a few weeks. It did
cause some embarassing moments when I stepped on people who had
been using the repeater for several minutes, though ;-) I just disabled
power-save and now I'm a happy camper.

No one knows, not even ARRL. It isn't an acronym as far as anyone can determine from history back to 1900. The only suggested origin I've ever heard is that some British radio enthusiasts started using the term "am" as short for "amateur" (i.e., "My neighbor is a radio am"). Since "Cockney" lingo drops the letter h from the front of words which begin with h (as in "I'm going 'ome now."), it has been suggested that a listener may have thought a Britisher saying "am" really meant "ham" but was dropping the h. Hence, the beginning of the term "radio ham." It may be a pretty weak argument, but traditions have begun in other pursuits from even more inauspicious origins.

DX is an internationally-recognized abbreviation for "distance" and goes back to early radiotelegraph days of ships at sea. In fact, most abbreviations used today trace their origins back at least that far, and in some cases all the way back to the days of the landline telegraph. A few were chosen from non-English languages for their brevity; for example, the use of "DE", as in WA3XYZ DE K4MSG. "DE" is French for "from", but it is shorter in terms of characters and character elements than, say, "frm" or even "fm" (with the latterrunning the risk of being interpreted as "frequency modulation," although admittedly FM was developed long after "DE" came into use by radio telegraphers. In CW, "DE" vs "FRM" would be -../. versus ..-./.-./-- so it would save time. It seems a small thing, but when handling CW traffic through the static crashes on LF, using (ugh!) spark, every little bit would help.....

: Charles is right. Almost every repeater in Germany has to be opened by
: transmitting the 1750 Hz tone. If there are two or more repeaters in an
: area, then the are using different frequencies.

No wonder. It s the same here in France. 1750 Hz but for the transponders,
which are normally "transparent" - always opened. In France, repeaters also
have a timeout (90 s), meaning that if you don t let a "K" or "T" go by,
you are fired after the delay. I dunno about German repeaters.

I must have the section of California wrong. I'm constantly hearing
accounts from people who indicate that listening to some of the
conversations on CA 2 meter repeaters reveals language which is actually
worse then what you hear on the 27mhz band.

Ha, have I got one for you. When I finally passed my general, I
came home and went to 20m. Now as a tech+ I had never even
listened to 20m, so this was my first experience with that band.

I listened for a dead piece of band, asked if the frequency was
being used *3* times with no response.

I then called CQ and unkeyed to hear,

"Are you stupid or just deaf? This frequency is being used. So
shut up and leave"!

I then removed myself from 20m and now only go there fro a
little slowscan.

Nice way to treat a newbie huh?

I will be getting a direct conversion receiver kit from
ten-tec in couple of days. I want to use this radio to
receive code practice sessions from W1AW - about 40 to 50
miles from where I live.

I can build this for either 40m or 80m. For the 40 to 50 mile
range, which band will work better? I will be doing most of
my listening in the evening, if that makes a difference. (Also,
I could easily string out about 100 feet of wire for an antenna..)

Many thanks in advance!

Stuff deleted

"for ID" is one of my many pet peeves. Why the heck else would you say your call? You ALWAYS give your call "for ID." It is just an annoying habit.

>And while I'm at it, what is the purpose of those CQ DX calls that
>say "beaming the Pacific" - not "CQ Pacific", but "CQ DX, beaming
>the Pacific"?

** More stuff deleted**

The only possible use for such prattle is to make a longer call to give a potential respondent time to get you tuned in. Mostly tho, someone heard someone else say it, thought it sounded pretty good, so they say it too.

>It might make communications much easier if we just said what we
>meant all the time, which means proper phonetics and procedures.
>The cute stuff is OK when you know you are S9+, I suppose.

Hear hear!!! Here here, too. There are so many examples of silly things hams say on HF and VHF/UHF that it is embarassing to have a non-ham hear most of it. Around here, "By golly" is a biggie, along with "and stuff" and "for id."

I tell newbies to talk just like they would on the phone or in person. When you get home, say "I'm home now" and not "I'm at the home QTH." There isn't any good reason to say "73" to someone when it is just as easy to say "Bye," but for cripes sake, don't say "73's."

Don't forget, teacups have handles, people have names.

>
>Cheers,
>
>Ian.
>
According to page 12 of my Azden 2000 manual, use silver oxide cells
such as S76, MS76, RS76, or 76SO. My personal experience is that these
cells don't last long, so I have my radio wired to the battery in my
truck, so it is constantly supplied with power. This way you don't need
the backup batteries to maintain memory. (BTW, you don't have to install
the batteries if you don't mind losing memory on power down)

If you need a photocopy of user manual, send me a large SASE and I will
try to make you a photocopy.

I hope your Azden serves you as long and as well as mine has. :-)

I have a feeling that those have responded to this so far perhaps are
taking this statement the wrong way (please correct me if I'm wrong,
Roger). My interpretation of Roger's statment is that having 90% of HAM
repeaters closed to all HAMS is not necessarily in the best interests of
HAM radio in general, and that something needs to be done about the
attitudes or circumstances that have led these individuals or organizations
to keep thier repeaters closed. I never got the impression that legal
action was being considered or promoted.

Source record: 266470

Lucky I've got mine sitting right in front of me. With my TH-28, you
don't have to modify it to recieve the 118 MHz band. There was a little
yellow sheet included in the docs for the radio that told how to do it.
Press and hold the "F" key for longer than 1 second
press the "Low" key
The radio will then (at least on mine) recieve from 118-135MHz. The
manual for the TH-28 says NOTHING about this, only the little yellow sheet
that was included with everything else. The display will show a spade
symbol when you are recieving in this range.

These opinions are mine, because nobody else really cares what I think!

JEFF M. GOLD writes:

>#1) how does a thru the glass 2 meter antenna actually work?

Capacitive coupling using the glass as a dielectric.

>#2) what are its disadvantages?

It doesn't work all that well. It's not too lossey, but my experience is that the matching circuit ages badly in the car environment (hot/cold/vibration), and over time, it doesn't match all that well. Also, it's hard to get a ground plane working for the glass mount. Most come with a little tab that's supposed to be tucked under the ceiling liner to couple to the roof, but forget it.

My advice to you is to swallow hard and cut a hole in the roof. Pop a larson 5/8 in there, and you're set for the life of the car.

Source record: 266469

Another thing to remember:

The cost of the battery packs is too high for any of these HT's.

Instead of paying $50 for a second battery pack for my FT-530, I bought a battery holder for 6 AA-size cells.

I have two sets of AA NiCads which I rotate in this holder. Along with the original equipment Yaesu pack, this gives me three battery packs.

It seems to me these modern HTs have horrendous current drain, even if you don't transmit all that much.

Just remember to charge the AA cells with a constant 60 mA of current (600 mA-hr cells) for 18 or so hours.

I tried the TH-78 and the FT-530 and decided on the FT-530 even though the TH-78 was $10 less from AES.

The ham club here has two TH-78s and they seem to be okay. Incidentally the FT-530 replaced an FT-411E which had earlier replaced a K'wood TH-25.

They're all good rigs and I don't think you'll go wrong with any of them.

Few people will use all of the featrures, but they're nice to have.

Do you really need to use your rig as an alarm clock? I doubt it. But each morning mine turns on and gives me the weather from the local weather station.

Sometimes I think my FT-530 is a scanner with a builtin XMTR.

Hello,

At the Rochester, NY Hamfest last weekend I bought a speaker-mike
for my ht. It has a specialized connector to fit the HT it was
designed for. In order to use it with my Alinco DJ-F1T, I must
replace the connector with what matches the ones on my Alinco ht.
Does anyone know where I can buy one? or do I make it myself?

: it and the Alinco mike. Joe Salemi, KR4CZ

Hi Joe, like I said, if you're happy with an extra 50mAH drain from a 700mAH battery, that's fine. My comments are for people who want their batteries to last longer. You obviously don't care. I have measured the two speaker/mikes and the difference is hours in receive. You don't notice things like that... that's cool. If one wants to fix the problem, one can always build an adapter cable with a stereo plug on it and still use the RS speaker/mike... or one can choose not to notice the problem.

So? you could get hit by a beer truck crossing the street or pull out in
front of a 45 ton concrete truck and he crushes your car because he can't stop
and can't swerve w/o increasing the body count.

Heck, you could pass the test and fall down the steps leaving the exam room at
the place we have exams - hit your head and lose your memory of ever having
interest in radio at all...

If one guy did this and was successful, the FCC would be tied up verifying all
the "gonna die soon" requests for expedited service.

It's a shame but it's happened before and will happen again. It could happen
if the licenses were even generated at the test site...

People that want a ham license quickly should start sooner 8)...

>the big whigs don't consider ham radio to be that important anymore.
>Darrell Shandrow at Arizona State University

actually a lot of big wigs are or have been involved in amateur radio.
they'd probably wax a whole herd of african or indian eloquents if they got
talking about their experiences in the service.

However, there certainly are a lot of people with clout trying to have
everything their way - would the general public consider holding up CATV
regulations in favor of a few hundred license apps?

I actually don't think the FCC wants to go slow on ham licenses - they take
their share of heat for it. There have been proposals for "instant licensing"
but in general the amateur community and the ARRL came in against such an idea
so instead of being able to put a WZ4WEN/KT on the air for a couple of months,
they have to sit around and wait. (you DID comment favorably on that proposal
back when, right?) After all WZ4WEN could be a bootlegger whereas we all know
that KF4TSR is a legally issued call, right?

(yeah, i'm aware of the concerns about that proposal, but i think the
objections were more from "it's not the way we've done it" than from the real
problems that could happen with such a system.)

bill wb9ivr (who would have been WZ4WEN if I was starting out today under the
shot-down instant licensing proposal....until the government could catch up)

NAME JEFF M. GOLD, MGR ACS (jmg@tntech.edu) wrote:
: #1) how does a thru the glass 2 meter antenna actually work?

: #2) what are its disadvantages?

Hi Jeff, I believe the antenna works thru capacitive coupling. I believe the antenna works great. I had a Larson 2M whip on the front window above the r.v. mirror. There was absolutely no difference between that and the 5/8 mag on the roof. It is a very clean installation, easy to remove and replace on a new vehicle without doing anything invasive. I had a bit of trouble when I pryed it off the first vehicle and put it on the second. When I sent the unit back to Larson for tweakin of the coil, they sent me a new one free of charge.... THAT'S CUSTOMER SERVICE WITH A PLUS....

The only problems I am aware of is placing the coupling heads over reflective window tinting. Some of the tinting materials don't look reflective but cause problems with proper operation. Larson or other mfg's should be able to help with vehicle types of tinting spec's

Good Luck, Bill/N6GHG

Hey.. don't forget the magazine publishers too! I wonder if the ARRL is
among them? Lets see, if we can sell x number of new subscriptions, that
means that x number of people stay employed and get annual increases.
Hmmmm.....

Oh please, if you want to do "Smokey Reports" keep it on 11m. We don't need traffic advisories on the amateur bands.

Sure do. After you speak your piece say your callsign at the end. If you're
leaving the group say your callsign and then "out" or "clear". There's
absolutely no need to say "For ID". We've often wondered when the FCC
started giving out 1x2x3, 2x1x3, 2x2x2, 2x3x3 etc... calls out. (Get it,
KD1NR4ID)

Yaesu has released a new version of that speaker mike with a small hole
drilled just above where the microphone is located. If you send your
microphone to Yaesu (America) they will replace the face plate free of charge.
You need only pay for shipping and handling (or so they say)..

As for the output power, damn good question..

You must've hit one of those "Forbidden Frequencies". In that case I would
have told the guy to take the plugs out of his ears and listen.

You can use your american callsign, but with the suffix of that area you are in (eg: In the maretimes, you would use N1QVE/VO1 etc..)

I have found that the ARRL repeater directory does cover repeater listings in the area I am in (British Columbia) so I would assume that there should be some sort of listing for the areas you will be visiting. If not, you can always try a local radio store..

2588. RF Overload in an FT-767 ?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-23 16:51:16 UTC
From: MAYNARD@URIACC.URI.EDU
Message-ID: <199405231656.JAA26913@ucsd.edu>
Source record: 266588

Thanks for reading...

I have a Yeasu FT-767GX exciting an MFJ-962C (1,500 W tuner) and All-Band
er dipole from Van Gordon (135' and balanced feed). I have been playing around
with tuning on a variety of bands and ran into an interesting problem on 15 me
ters. At any frequency in the band (eg. 21.050 to 21.400 Mhz) the sidetone on
the FT-767 overloads, presumably with RF from the tuner. This becomes a proble
m at more than 75 watts output. The SWR is 1:1 between the tuner and the excit
er. Anyone have ideas on the problem and possible fixes? I tried isolating th
e grounds without success. The two pieces of equipment are about 2 feet apart
- should they be farther apart? I appreciate your reply...

**** deletes

>I tell newbies to talk just like they would on the phone or in person. When
>you get home, say "I'm home now" and not "I'm at the home QTH." There isn't
>any good reason to say "73" to someone when it is just as easy to say "Bye,"
>but for cripes sake, don't say "73's."
>

You reminded me (or should I say us :^) of one I heard around here.
A guy said, "We're building a new QTH." The more I thought (big mistake)
about it the more I had to laugh. He said he was building a new "my
location is" or simply building a new "location". Did he do this by
extending one of the (presumably non-infinite) dimensions of the
universe? Or did he add another dimension? There's a chance he meant
that he's building a new house, I guess.

But I don't hold this against him. People I hear (including me) use
lingo, cliches, cute phrases, etc. often. Some of it bugs me. But
hey, it doesn't make the person bad. A lot of smooth talkers are a lot
worse, IMHO, than the ones that verbally abuse my sensibilities.

2591. NMO Permanent mount in Plymouth Voyager?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-23 16:57:56 UTC
From: sxb@gibbon.inel.gov
Message-ID: <2rqnak$ktg@mica.inel.gov>
Source record: 266399

I sucessfully completed my first permanent NMO installation over the
weekend in my Jeep Grand Wagoneer. Before I installed the mount on
my Jeep, I asked around and found someone who had done it and he gave me
instrucations about how to proceed. My wife was so impressed with the
professional-looking results that she wants one in her 88 Plymouth Voyager.
Upon asking around, however, I have heard that the Voyager (and Caravan)
models have double walled construction that may cause severe
installation problems. Before I drill a 3/4 inch hole in her roof,
could some voice of experience please provide some guidance? I am
interested not only in whether it can be done, but how to route the coax
thorough the headliner, if it can.

Thanks,
-Steve

What is the big deal? You folks need to get a life if listening to someone say "for ID" gets your goat. I suppose a station from Georgia saying "Ya'll" also cause you to have a minor coronary. Maybe we should start a "Hams for correct use of language" movement and have anyone that doesn't agree with our views on proper usage denied a license? Among a set of friends, we used to use "RTG" for "ready to go?". Or how many times have you someone say "That's a whole nuther issue." (or however you might spell it.) So they miss use something, big deal! If you don't like it, tune in somewhere else.

73s,

> call? You ALWAYS give your call "for ID." It is just an annoying habit.
>...

I disagree. I often have to ID when more than one person is involved with a QSO, and the other parties are having a conversation I'm not actively participating in. If I say "KB5YAC" and nothing else, I interrupt the flow of their conversation, they say "go ahead", and have to come back and say "I'm just ID'ing". Then if I don't ID when I say "I'm just ID'ing", I have to ID again in 10 minutes, even if I just listen for the next 10 minutes. If I say "KB5YAC for ID", it causes the minimum disruption of the QSO in process. (Unless someone asks "Why the heck else would you say your call?", in which case I have to explain that I am not asking to be let in, I'm just obeying the rules.)

The local repeater etiquette is to normally break in by giving your callsign. "break" is normally used to indicate some level of urgency. This makes a callsign without "for ID" confusing in some circumstances.

I had the local net control on the weather net (jokingly) ask me why else I would ID. I told him. Half an hour or so later, I was conversing with him about some weather information and got interrupted by another ham with fresh information before I could ID. So, when there was an appropriate gap, I ID'd and the net control called me back, and I had to tell him I was just ID'ing.

In addition to what John mentioned, there is a fairly strong contingent
of oil-field communications set at 36.5, 37.0, 37.5 and 38.0 MHZ, these
being wideband fm phone and (surprisingly!) some AFSK-sounding stuff that
my PK232 wont decode, someone said it's ARQ-K3 or somesuch...

At least in Calif, the old 40-50MHz MTS is gone, as of like 1985
and the local repeaters were torn down, I sure wish I could have bought
some of that stuff to convert to 6 meters!

There is a small number of harbor patrol transceivers running on
32-35.5MHz, and ocassionally I hear what sounds like DEA/FBI/CIA/NSA
spook stuff going on in the 38-48MHz area, all fm phone with tactical
```

callsigns.

I would recommend a chat with the FCC. You might be able to actually GET a special-use license/permit for a limited time, or they can advise you regarding the use of remote-control in that freq range. Here in the US the public is allowed to operate r/c license free in the 72-73 and 74-75MHz area, with 1/2 watt, am or fm (fm prefered, better yet using PCM or an advanced (high sample-rate) digital PCM. Your equipment, if modular, might be converted to run on the 72-73 MHz band. You didnt state which company manufacturered your gear; The japanese companies (Futaba, et al) usually offer different transmitter and receiver modules for the various bands worldwide. It might be a case of new receiver, new tx-module and go fly!

I did exactly that when I decided to switch from the 72MHz band to six meters, I ordered and installed the different stuff to my existing Futaba 7-FGK systems (I have 2 am and 2 fm systems now all on 6m) Look in the r/c newsgroup for more info...rec.models.rc

That's only true for a couple of repeaters. The rest of the area,
IMO, is quite polite and respectful. I'm just wondering why people
that disagree with what goes on on certain repeaters bother to
listen in?

>of which a traffic violation has nothing to do. AND, what's the
>difference, then, between a notice on the radio about a radar trap
>compared with a signpost indicating that radar may be used in that
>particular area?

My brother once got a ticket for flashing his headlights at oncoming cars to warn them of police radar ahead. This was in Canada - your mileage and fine may vary. I dunno what the official charge was and what they do in foreign countries may not be relevant here. I think it's Canada (Ontario) where the police can confiscate radar detectors, and you might well lose a 2m radio that way too.

Each new subscription means one more person stays employed? I think
you mean "y number of people", although the algebra is tough to solve
without another equation somewhere.

The ARRL actually gives people raises? I'm shocked! What a terrible
waste of money - how can they hope to stay in business with an attitude
like that? What a bunch of losers. I'm tempted to resign - do you
realize that ARRL membership costs around 8 cents per day? Daylight
robbery!

I am looking for suggestions on QSL'ing to Jordan and Morocco. I have sent QSL's to both contries with green stamps. Never received replies.. this has been over 2 yrs... Is it correct to sent G.S.'s or are IRC's preferred. I've heard that US Currency is illegal in some countries...

2nd Question... seems I have heard some problems QSL'ing via F6FNU(?) Any problems I should be aware of? What I remember reading about is a grey fog. May have been some rare but unhappy customers.

3rd Question... QSL'ing Germany... Is one IRC/Green Stamp ok? I have heard problems here too.

Any help/suggestions appreciated... Bill/N6GHG

I have never had any difficulty getting QSLs from F6FNU. Word is that he
requires US$2 per card, but I've always enclosed $1 (the reduced
rate airmail that he uses ends up costing about US$0.40 or so). Just
be sure to fill out your card correctly and enclose an SAE.

>3rd Question... QSL'ing Germany... Is one IRC/Green Stamp ok? I have heard
>problems here too.
>
Current German airmail rates are over $1 now. So, apparently one green
stamp won't do it. I've had recent success for Germany (for a 5R8DJ card)
with US$2. There's still confusion about how much an IRC may be redeemed
for in various countries. Whether one IRC will actually yield one unit
of airmail postage to the US (from Germany) is unclear. There was an
effort to compile a list of how IRCs are redeemed in various countries,
but I don't recall it being updated recently.

My earlier comment was NOT intended to imply that there are no "true hams"
on 80 meters...there are lots of them. It's just that 80 is where I've
also encountered a lot of rude folks. No offense intended whatsoever to
all the fine ops who (like myself) enjoy 80 M. I just meant that we need
to be aware of some of the lids lurking around...this can be especially
disheartening for a "newbie" like the one I talked to the other night, who
was just about run off of the band by some guys who had a frequency
apparently "reserved" - although they were NOT a net and were NOT using the
frequency. Thanks for the response.

>people who are monitoring on their scanners. It seems like the trend is for the

One night (actually about 2AM) I was heading home and there was a car ahead of
me. The operator acted in a drunk manner, weaving etc. In the distance, a
town police cruiser had a vehicle stopped. The drunk driver didn't seem to
notice the squad, and the officer (who was speaking to the stopped driver) had
to jump away to avoid being hit. I then followed the drunk driver for a while.
In a short time, I saw the town squad in my rear view mirror and recognized the
officer from high school. I then picked up my ham radio, dialed the county
dispatch on the autopatch and told the operator, "This is Winnebago RACES
operator 69, if you would, notify X-Ray 52 that the vehicle two ahead of his is
the one that he is looking for." Her response was "Ah, okay, thanks for
calling." I then switched the radio to the police freq in time to hear "X52,
be advised that the vehicle two ahead of you is the one you want." He said,
"Huh? Oh, I get it, 10-4." And, it took all of about two seconds for the old
red and blue to go on and the squad car to fly by (with the officer giving me a
wave.)

So, that is sort of a scanner story.

And, I am going to send this to rec.radio.amateur.misc (as well) for comments
on proper use of autopatch, etc.

>There's still confusion about how much an IRC may be redeemed
>for in various countries. Whether one IRC will actually yield one unit
>of airmail postage to the US (from Germany) is unclear.

No, it is quite clear - one IRC is not enough. The confusion arose
because the airmail IRCs say they are good for "airmail to a foreign
country" - but they don't specify which one.

Here, airmail is the same rate to all countries (excl. VE, XE and
Central America, I think), but from Germany it is cheaper to send
mail to Switzerland than to Mongolia or the US. So the IRC is
only worth the "mail to Switzerland" rate, and that is not enough
for mail to the US. So you need to send 2 IRCs. If you are
kind you will probably send 3 IRCs, which costs you $1.50 if you
get them from QSL managers at the standard rate of 2/$1. If you
insist on sending dollar bills, one is not enough for mail from
Germany so you need to send two - but 3 IRCs is still cheaper and
will leave some spare change for the person sending you the card.

I have heard this happen a number of times on HF. The "moderator" of a large group or roundtable would announce "ten minutes is up, time to ID" and for the next five seconds EVERYONE id'ed at the same time and then the discussion in progress would continue.

I make no claims as to the validity of the process!

Mahon Loomis - yup!

Didn't exactly invent radio, but he did experiment with atmospheric
communications. Seems he flew two kites with wire for leads. In one lead
was a telegraph key and in the other a primitive galvanometer.
Keying one circuit gave a reading in the other, which was located several
miles away.

That's serious qrp work.

2620. Test session wierdos

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-23 20:27:58 UTC
From: markm@bigfoot.sps.mot.com
Message-ID: <1994May23.202758.2452@newsgate.sps.mot.com>
Source record: 266609

Somewhat along the lines of the thread about the color of the 610 forms, we had a guy at our test session this past weekend who refused to sign the 610 because of the wording of the certification that all the info was correct, etc. etc. We told him the FCC probably wouldn't accept the form without a signature and the guy got all steamed about his rights, etc etc. He got real belligerent and disruptive so we asked him to leave. He did (luckily) but not before a lot of very loud foul language and threats to sue us all etc etc. Anyone else ever have something like that happen in a test session?

I'd be interested to hear some of the stories about VE sessions. We've had a heart-attack scare (during a code test ;-) ...the guy was OK after popping some nitro pills), a guy who wierded-out during another code test (he was real nervous...listened to the warm-up, stood up, threw off the headphones and went into a long tirade about how he was 43 yrs old, a Mensa member, had worked on the code for 2 years and just didn't understand why he couldn't get it. He got real agitated and left the room...we were worried he was going to shoot himself in the parking lot), and some who argue about the results and just can't believe they didn't pass. On the other hand, we've had people who were so happy to pass they start hollering and jumping around (we give our tests in the local public library and they get a little upset at people making lots of noise).

I guess it takes all kinds. Keeps things interesting, for sure.

Anyone else have any interesting VE stories to add?

I'm building a new house and am planning to use CATV (cheap!!) cable to get to the towers (abt 300' from house). Many people say to forget abt the mismatch. There is also a company that sells expensive 75 ohm to 50 ohm transformers. Has anyone made a simple and inexpensive transformer to convert a 75 ohm impedence to the 50 ohm the rig and antennas want to see?

Message-ID: <1994May23.212936.21163@selway.umt.edu>
Source record: 266381

I bought the RS DSP unit several weeks ago. Its strongest point seems to be removal of hetrodynes and other continuous tones from audio. I use it to help clarify the AM voice reception on international broadcasts with my Japan Radio NRD-535D receiver. (That receiver has rather muffled reception of voice, normally.) While the DSP is not a miracle worker, it does do a nice job of clarifying international SW broadcast audio. It also does a pretty good job with QRM on some amateur SSB transmissions

I hope that helps.

> KD1NR4ID)
>
> Tony
> ...

That only works if you 1) ID at the end of every transmission or 2) always say something every few minutes.

If I'm in a QSO with 5 or 6 people and they get involved in a discussion that I don't have anything to contribute to at the moment, I keep my mouth shut until I have something to contribute. I'm not leaving the group, I'm just not speaking until I have something to say. (Actually, lots of hams should learn the "If you don't have anything to say, don't say anything." rule.)

The most efficient way in this case to obey the rules is to say "AA5AA for ID". It gets the message across, causes minimal interruption to the QSO in progress and allows you to get up and leave in the next 10 minutes if nature calls, someone knocks at the door, etc.

If you have to ID just for the sake of rules compliance, it's the most efficient way to do so. (Unless someone invokes the "Why else would you ID?" bandwidth waster.)

It may be superfluous to say "for ID" when you are saying something else in the transmission, but it's just common courtesy to say "for ID" when you are just ID'ing.

This would get even more tedious in a two or three person QSO, but
may be a good idea in a roundtable, esp when people have a hard time
remembering who gets it next.

I have a basic DJ580T setup with:

EDC-24 charger (8.7v 70ma) rated for EBP-14/16/18 batteries
EBP-20N 7.2v 700ma battery (came with the radio)

I purchased an EBP-24S (7.2v 1500ma) Periphex battery pack which did really well for the first six months that I owned it. I charged it with the EDC-24. Now the Periphex pack doesn't last very long on a charge (less than the 700ma battery). Has anyone had similar experience? I noticed that Alinco sells an EDC-49 battery charger that is rated for the EBP-20/22/24N, should I get this to charge the pheriphex battery?

Thanks for any advice,
Charles

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 23/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 23 MAY AND FORECAST UP TO 26 MAY

IPS Warning 14 was issued on 21 May and is current
for interval May 24-25.

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 081/022

1B. SOLAR FORECAST
24 May 25 May 26 May
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 079/019

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet

Estimated Indices : A K Observed A Index 22 May
Learmonth 09 3222 ----
Fredericksburg 07 08
Planetary 08 09

Observed Kp for 22 May: 2222 3332

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
24 May 18 Active.
25 May 18 Active.
26 May 12 Quiet to unsettled.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
23 May normal fair fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
24 May normal fair poor
25 May normal fair poor
26 May normal normal fair
3C. GLOBAL HF PROPAGATION COMMENT
Degraded HF comms expected at mid and high lats May 24-25.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values

Observed T index for 23 May: 41

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
24 May 40 Near predicted monthly values.
25 May 40 Near predicted monthly values.
26 May 40 Near predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
Strong spread F observed during local night, and is again expected
during local night tonight. Degraded comms conditions are expected
during the interval May 24-25 due to expected coronal hole sourced
activity.

You're confusing not being able to use the machine with not being able to use the frequencies - these are not synonymous. Since the machine is private it has a coded squelch. Feel free operate simplex with others either on the input or output when the repeater is not in use (you'll have to monitor the output).

Some folks are under the mistaken impression that repeaters are public property, but of course, that is not the case (and has been affirmed by a California court).

Rather than trying to invade or force closed repeaters to open, why not, instead, ask yourself why closed repeaters exist?

If you WERE successful in opening a closed machine, would any of the members want to talk to you?

> SL> So, would it be better if there were FEWER total repeaters and more

I'm all for banning any new repeaters. Encourage more simplex operation. I can remember when L.A. had only one repeater (K6MYK - Art Gentry's AM machine up on Mount Lee, Hollywood Hills; How is Art? - heard he was in the hospital).

I've since left VHF for HF CW. Love it!

: Can someone give
: me come technical information about NiCads? How do you take care of them?
: Do you leave them in the charger untill you need them? Is there such
: thing as "the memory effect" with NiCads? ...

Here's info on the subject I posted a week or so ago:

Subject: Nicad Batteries - The Offical Word
Newsgroups: rec.bicycles.tech

Awhile back, John Stevenson of MBUK emailed me asking about the "memory"
effect in nickle-cadmium rechargable batteries. I recently acquired
an engineering handbook published by Sanyo, maker of "Cadnica" brand
nicads. I thought the information would be of general interest.

In the following, "C" is the amp-hour capacity of the battery. For
example, if you have a 5 A-hr battery, a charging rate of "0.1C" is 0.5A.

From Sanyo's handbook:

"Nickle-cadmium batteries have a "memory effect" in which the voltage
drops by 2 levels during discharge after shallow charge/discharge cycles.
In application when discharge end voltage is highly established, apparent
decreases in capacity and operating voltage are shown."

A graph shows a series of discharge curves (voltage versus time) for a
battery under the following conditions: (1) Fresh battery, (2) First
discharge after 100 cycles, (2) Second discharge after 100 cycles,
(3) Third discharge after 100 cycles. The "cycles" consist of a 0.1 C
charge for 10 hours followed by a 1C discharge for 10 minutes. The
"discharge curve" is measured after a final 0.1C charge for 16 hours
followed by a discharge rate of 1C.

The four curves are almost identical. As near as I can read the graph,
The first discharge after 100 memory cycles drops to 1V after about
63 minutes, compared with about 66 minutes for the fresh battery.

Bottom line: Yes there is a memory effect, but it is very small and
not worth worrying about.

Other Nicad tidbits:

Charging:

"As long as a Cadnica battery is charged at an input rate below the
specified value [typically 0.1C] internal gas pressure remains at a

low level. However, heat generated by gas recombination causes a rise in cell temperature. When overcharging is repeated often, heat deteriorates the cell and shortens its service life."

So don't overcharge excessively. It's OK to leave your battery on the charger overnight (up to 18 hours or so if the battery was well-discharged) but don't hook it up to the charger and go away for a week.

(Actually, my lighting system is supposed to have circuitry to prevent overcharging, but I don't depend on it.)

Discharging:

"The number of cycles Cadnica batteries can withstand depends on the depth of discharge... When the cell is discharged to a greater depth, the number of cycles decreases."

Some folks have recommended that occasionally you intentionally completely discharge your nicads to eliminate the memory effect. The above implies that that's a bad idea.

Storage:

"Cadnica batteries can be stored at temperatures ranging from -30 degC to 50 degC without essential deterioration in performance. The organic materials, such as gasket or separator, may deteriorate or become deformed at high temperatures during prolonged storage. Thus it is recommended that Cadnica batteries be stored at temperatures below 35 degC if there is a possibility of prolonged storage surpassing 3 months." [35 degC = 95 degF]

"Either charged or discharged Cadnica batteries may be stored indefinitely. ... Though the capacity is recovered with a couple of charge/discharge cycles in either case, the capacity of a discharged battery is more quickly achieved."

Unlike lead-acid batteries, nicads are perfectly happy being stored in a discharged state. In fact, they prefer it.

"Batteries should be recharged prior to use after prolonged storage."

The reason for that is that various cells in the battery can lose their charge at different rates. If you then use the battery without recharging, the weakest cell can become reverse-charged by the other stronger cells. That can kill a battery.

: suffer the same or higher level of jamming, obscene/foul language, etc.
: that the more "wholesome" open repeaters have?
: There is certainly nothing "illegal" about a closed repeater, right? Or,
: has there been a new FCC (not ARRL) edict on this? I know we don't
: "own" the airwaves, but there's nothingin the rules that I've read that
: says that ALL repeaters are owned by the public.
: So, would it be better if there were FEWER total repeaters and more
: simplex channels or, should we have more repeaters and make all of them
: "open", or what?

Nope, it's not illegal for repeaters to be closed or private. It IS
unwholesome, however, to have virtually an entire band's worth of
repeaters closed and private, excluding the average ham. These repeaters
are rarely used, and appear to serve as often as not as private
communications services for the repeater owners. In an area like So Cal
where there are lots of hams and crowded frequencies on 2 meters, it is
obvious to most of us that the present arrangement is far from satisfactory.

You are quite right that repeaters are often/usually privately owned.
But the frequencies they utilize are in the public domain for licensed
hams.

Personally, I believe that repeaters should be allowed to be closed or
private at the whim of the owner. But I also believe that closed and
private repeaters should simply not be coordinated, as in most cases such
repeaters do not represent optimum use of the spectrum. Many, I'm quite
sure most, amateurs in the area agree with me, and that is what it will take.

: AND, out of curosity, just exactly who is the "we" that are going
: to do something about the unwholesomeness of closed repeaters?
: And just what and when would "we" do it?

Stay tuned :-)

: 73 de Sandy
: WA6BXH - slay@netcom.com
: PS: I don't live in California and have only very, very rarely used a
: repeater - open or closed, during my own 30+ years as a ham; so I

A fair interpretation of my remarks. Frankly, I've been trying to find
the time to get up a petition among Southern California hams to the ARRL
to challenge whether or not the present coordination of the 440 band is in
the best interests of the hobby. I've almost never spoken with an amateur
here in the area who is happy with 440 as it stands. A start would be to
challenge the ARRL sanctioning of the present coordination group.

It'll be a while before I get much done, as I start Law School in a few
months.

Hi All. There will be a statewide emergency drill in Illinois on Wed. 5/25.
We hope to use some of the hams around the state to help out with some
communications and simple message traffic. For want of a better meeting
place, look for me on MidCars (7258) between 8:30 and 10:00 if you have
any contact with your local Red Cross chapter. Tnx for your help.

I don't know how much K1ZZ makes, but whenever I've seen ads for ARRL jobs, I have been surprised they could get anyone to work for the advertised salaries. I remember that one job called for a BSEE with years of experience but that it only paid something like $22,500.

2646. Hold Welfare Traffic

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-24 03:47:00 UTC
From: greg.pool@nitelog.com
Message-ID: <cb.18242.2099.0ND04EEA@nitelog.com>
Source record: 266294

Hold Health and Welfare Traffic
Greg Pool WH6DT

During a disaster, we hear many Amateur Radio stations passing welfare traffic. It's the easiest traffic to pass, there's no time limit and it is the most visible part of emergency communications.

Many times an operator will sit on a 40 or 20 m frequency specifically because they have everything set up for a phone patch into a specific area of the country. Sometimes operators are given free long distance accounts to place those calls. Everyone can hear the anguish in the voices over the phone and the caller thanking the operator over and over for their dedication and service.

That kind of instant gratification can be intoxicating for the rest of the Amateur Community, to the point of passing welfare traffic without considering the consequences. From my own experience in disaster communications, most welfare traffic is supportive but not necessary. In fact holding on to that initial query will probably get you an answer faster than if you had actually sent it.

Incoming vs Outgoing
Let's divide it up. There's INCOMING welfare traffic, where a party sends a message to a party within the disaster area; and there's OUTGOING, where the party within the disaster sends a message to the outside.

What does it take to run an outgoing message? It takes an operator in the disaster area and anybody on the outside willing to pass it. Usually there are more than enough volunteers to do help deliver it.

But incoming is much more intensive. Not only does the operator on the inside accept the traffic, they either finds a runner or run it themselves. Rarely are either of those choices viable options. You cannot leave your station, the person next to you already has 20 things to do, and the phone lines must be left open for civilian and civic disaster relief agencies.

Thus, incoming welfare traffic is a luxury. The victim will get word out eventually, even originate their own outgoing message. If they are dead, they are dead; your messages will not help them. If they are injured, then a disaster relief agency will attend to them; but if you are a thousand miles away, what more can you do? By sending that message, you tax the relief effort even more.

We Were Not Thinking
The Amateur Radio response to the Northridge Earthquake in Los Angeles

was replete with bad habits. Many Amateur Radio operators sent and accepted incoming welfare traffic on many of the HF nets and packet; there were very few "outgoing-only" nets. In the San Francisco Bay Area, one Amateur Radio operator provided his phone number to a local TV station so that people could contact him for incoming welfare traffic.

We were not thinking beyond just being on the air. We were not thinking about what it took to pass that traffic in the disaster area. We were not thinking about what passing incoming traffic took away from those in need.

Many of the stations accepting the incoming traffic used local phone lines to contact the disaster parties, and in the first few days the success rate was terrible. In doing so, however, it meant that someone who had emergency or priority traffic could not use the phone because it was being tied up needlessly.

It is a matter of precedence and responsibilitiy. The best thing you can do is not originate or accept any incoming welfare messages in the first week after disaster. There's usually nothing the sending party can do anyway except wait or sponsor a disaster relief agency. Why tie up the network needlessly?

Instead, stand by to originate and accept outgoing messages. You will not handle as much traffic, and I may not hear (or see) your callsign as often, but you will have freed up an operator in a disaster area to become part of the solution and not part of the problem.

Hello,
I've been trying to track down an article that I remember seeing some time ago, probably about 10 to 15 years back. I've search the libraries periodical guides and the QST indexes and have had no luck.

The article was about constructing an audio filter to go between a receiver and a pair of stereo headphones. The filter was a low-pass to the left speaker and a high-pass to the right speaker. When you tune in a CW signal, the signal you're trying to copy will appear to be 'in front' of you, while other signals will be to your left or right.

If you have a copy of the article, or can tell me what issue of what magazine it was in, please let me know.

Thanks,
Chris N6IYS

cjackso@uswnvg.com (Clay Jackson) writes:

>Has anyone had any experiences with the new RS DSP unit? For $79.95,
>it seems pretty reasonable, if it works!

C'mon, folks. This is old news. For those who missed it the first few times it appeared here, here it is one more time...

The RS DSP unit is a great unit for the price.

HOWEVER... it is NOT a noise reduction unit! It is advertised as one, but it does not do it. No, it does NOT work poorly. It does not work at all. The book even goes so far as to rate it at 20 db reduction. This is NOT true. Not even 1 db!

The good news is that it is a great bandpass filter with 9 positions of selectable bandpass. It is also a great automatic notcher that handles multiple heterodynes. That feature alone makes it worth more than you pay at RS for it. That's why I say it is a great unit for the price.

If you are expecting a noise reduction unit, skip it. If you want a good buy on a combination auto-notcher and bandpass filter, buy it!

I'm working with one of the Ft.Worth people now to see what can be done about the misrepresentation on this product. I really had the impression they took an interest in my complaint about this, but I'm not going to get very far from the oxygen bottle, either. He is supposed to get back to me again soon (yes, he has initiated calls to me).

At "garbo.uwasa.fi" in "/pc/ham" there is jvfax50 available, which is not
the latest version, but it is a follow-up of fax40.

A few month ago I remember, jvfax60 was available at oak.oakland.edu.
It might be it got lost when they restructured SIMTEL ??

OK, here it is.... It is documented, but everyone would prefer to just postulate.

Land line telegraphy preceeded radio. People with seriously impaired sending were refered to a being "ham fisted" (That's right, as in having a touch on the key that would tend to indicate an extra 40-50 pounds of weight for momentum).

Enter wireless technology. The landline was king, wireless was a new (and misunderstood) thing. The only people that saw a real need for it was the Navy and a handful of experimentors. A large number of the experimentors were starting in at the ground floor so to speak in that they did not have several years of landline experience. As a result, a majority of experimentors tended to have lousy fists. (i.e. ham fisted. Do you see this coming?) There was no FCC per se to designate who ran on what frequency. In fact with spark, and beginning C.W., (meaning continous wave, as in the type of output, not just meaning "on-off keyed signal") things got pretty hectic as to who was on what frequency(ies).

Hence the reference, "Here come those damned hams again". (As usual, the tendency to abbreviate anything to the minimum number of letters.) The amateurs (but really experimentors, they were amateurs only in that they were not commercial operators) took the term ham as their own. Much the same way that bug which had its origin as a truely terrible morse sending device became synomous with the vibroplex semi-automatic keyer.

Meanwhile, through history (and even amateur radio suffers from revisionism) people have tried to make the term ham something it isn't. It isn't an acronym (ergo, it is not HAM or H.A.M.) Nor is it a bastardization of some other term. It is simple ham. Short for ham fisted, a derrogatory term for someone sending sloppy code.

Did I mentioned documented? Read about it in _The History of the Vibroplex Bug_ and in the book _200 Meters and Down_.

What does HAM mean? It was an abbreviation that Craig Shergold used to ask the postman every morning as he waited to become famous. "Have Any Mail?"

When I took my test, a guy came in with his wife who was testing. He said he had thought about testing for his extra code but said he wasn't ready yet. He had previously passed the extra theory but had failed the code test repeatedly. Pretty soon everyone in the room was coaxing him to go for it.

Needless to say, he passed and was very surprised as he thought it would be years before he would be an extra. I thought this was a good example of the brotherhood/sisterhood/personhood of ham radio...

Radio Shack should be able to provide you with a copy of the service
manual. Go to the local store and order it through their special
parts ordering facility. Ft. Worth always keeps these on file and
will make a copy for you (their is surely a charge). If the store
won't help, call Tandy direct in Ft. Worth.

>and you might well lose a 2m radio that way too.

Well sure, that's Canada. Here in the US we still have the tatters
of a Bill of Rights. In a nearby local town they ran a vicious
speed trap. A farmer put up a sign just outside the city limits that
read, "Warning, speed trap ahead run by local parasites." They took
him to court trying to get it taken down, but they lost. The truth
is still a defense in this country.

It's not illegal to talk on the radio about any cop you see.
Our traffic reporters do it all the time. And it's not illegal
to follow cops around and photograph them in action, our photographers
do it all the time. Their activities are public, and hence in the
public domain.

>without a signature and the guy got all steamed about his rights, etc etc.
>He got real belligerent and disruptive so we asked him to leave. He did
>(luckily) but not before a lot of very loud foul language and threats to
>sue us all etc etc. Anyone else ever have something like that happen in a
>test session?

gotta wonder about these guys (i think we've had 2 or 3 over 10 years). A few years ago we were doing an exam at the local hamfest and someone came up and I started going over the application and asking for identification and such and they wouldn't produce any. so we wouldn't let them take the test (Sorry, we have to have an idea that you are who you say you are.) Candidate goes away and comes back with a bunch of allies who get all worked up over this and how they don't do this at their sessions and yada yada. Still the answer is no. They go grab the hamfest guys and now the hamfest guys (who only had tech licenses at the time) start chiming in. Fortunately about this time some of the ARRL folks happened by and listened in & joined in our side of the argument, pulled the hamfest guys aside to explain to them how the system works for examinations and such.

after the hamfest, we start getting letters from the backers of the unidentifiable person with all sorts of interesting enclosures. a lot in the ALL CAPS!!!! and crayon school of letter writing. quotes from the "amateur's code". I answer with copies of the requirements from the rules.

Eventually it all settled down.

Another one was a guy that would come to the tests, radio classes etc. and never take the exams. In classes, he'd generally try to be a pain in the neck of sorts...like you can't know 2 x 2 = 4 because of the heisenberg uncertainty principle etc. sigh. One thing that did come out was the guy had no problem copying code. I started carrying around a novice exam kit with me just so when ever this guy showed up, i'd be able to stick an exam under his nose.

He finally took the exams. missed extra by a few questions. got his novice license. the kicker is he would not supply the VEC with a copy of the license to get his advanced paperwork cleared, nor did he ever come back to take the extra written again. the guy's an SK now, but we did wonder what the problem was (he wouldn't talk about it) -- we'd wonder about things like did he have a license pulled and was afraid the FCC would find out? or was he on the lamb from the police in some state or something and afraid that by doing something like getting a radio license, he'd be raising his visibility? We never found out for sure - had to chalk it up to the guy just being "strange" -- although we did determine that his mailing address didn't match up with where he really lived....

I suppose the driver's license offices see a lot of this behavior as well..

* LUSAT-1 CRASH RECOVERY UNDERWAY *
==================================
On 16-May-94 while LU1JBR and other stations were operating LUSAT-1 (LO-19), the satellite's downlink vanished, a result of an on-board computer crash. By 17-May-94, LUSAT-1 command station (operated by Norberto Pennini, LU8DYF), successfully reset the satellite.

Norberto will start a series of deep tests and studies in order to find the origin of the crash. Reloading of operating software will follow the study. Please note that the satellite will not be operational for regular users for the next 7 to 30 day period.

LUSAT-OSCAR-19 controllers would like to thank LU8DYF and other stations who, in a way or another, collaborated and made this operation a success, including: LU6DYD, LU7AKC, LU7DSU, LU8ENU, LU4AGC, LU1EXC, LU2BDT, LW1EEO and LU3AGY.

[Info via Eduardo Sweet, LU7AKC]

* AMSAT CALL FOR PAPERS *
=========================
Share your experience with the amaeur satellite community at the 1994 AMSAT-NA Annual Meeting and Space Symposium scheduled for 07-Oct-94 through 09-Oct-94 in Orlando, Florida. Come help celebrate AMSAT's 25 year presence in Space. Your help is needed to make this meeting a success.

Papers for this meeting are sought. Editing, formatting, graphics and even typing can be provided if required. Prepare a paper and advance your reputation among others involved in the Amateur Satellite program! Even if you cannot attend the meeting, consider a paper for publication.

Topics for all amateur satellite disciplines are sought. Author and Title requested ASAP. Compose a short abstract by July 1. Final drafts are requested on or about August 26.

Direct inputs and inquiries to:
Steve Park - WB9OEP
12122 99th Ave. N.
Seminole, FL 34642
Phone: (813) 391-7515
Internet: SKPA@QMGATE.ECI-ESYST.COM
Amateur Packet Radio: WB9OEP @ W4DPH#TPA.FL.EL87OW

Join us in Orlando, Florida for the fun and festivities!

* CLEMENTINE FAILURE *
==========
After successfully completing a mission using advanced ballistic missile defense technologies to map the entire surface of the moon, the Ballistic Missile Defense Organization's Clementine satellite suffered an on-board malfunction at 9:39 AM EST on 07-May-94. The likely result of this malfunction will be to prevent Clementine from performing the planned close fly by of the near-Earth asteroid Geographos in August 1994, and for the satellite to point its cameras and sensors.

Preliminary analysis has traced the cause of the malfunction to the on-board computer which controls most of the satellite's systems including the attitude control thrusters. The computer activated several thrusters during a 20 minute telemetry interrupt with the ground station, thus depleting all the fuel in the Attitude Control System (ACS) tanks. It has not been determined as yet whether the fault was in the computer software or in the computer's electronic chips. The primary processor on the computer is a radiation hardened Military Standard 1750A computer, which is not experimental technology.

Clementine's mission control center in Alexandria, VA. is continuously monitoring the satellite. It has been determined that all instruments and systems are continuing to function well with the exception of the ACS.

Although it may be difficult to Clementine to make the close fly by of the asteroid, the satellite will continue to perform its intended military mission to test 23 advanced technologies. The Clementine engineering team is examining several mission options which would continue to yield useful data. Since January 25, 1994, Clementine's cameras have recorded over 1.5 million images including the topographical surface of the moon. Analyzing this data, including results of the search for the existence of ice on the lunar surface, will continue to occupy scientists for many years.

The Clementine project is managed by BMDO, built by the Naval Research Laboratory, and its instruments constructed by industry and the Lawrence Livermore Laboratory. It has been a landmark project since it demonstrates that small, highly capable satellites can be built and launched for under $100 million and in less than two years, using advanced miniaturized technology and a streamlined management approach.

[Info via Richard H. Buenneke Jr.]

* DISCOVERY OF ASTEROID MOON *
==========
NASA's space probe Galileo has discovered what is probably the first known moon of an asteroid. Since Galileo passed the asteroid, Ida, on August 28, 1993, the probe has continued to send back images and data from the near infrared mapping spectrometer. Because of the great distance at which the probe is from Earth, downloading this data will continue for months to come.

The Galileo Porject Scientist, announced on March 3, 1994, the discovery of a "blip" consisiting of more than a few pixels visible in data from both the solid-state imaging system and the spectrometer.

Based on simultaneous observation, a natural moon may be in orbit around Ida. If so, this would be the first satellite of an asteroid to be discovered.

More information will be forth coming soon from NASA, along with the first images of this possibly new moon orbiting Ida.

[Info via Dave, N9JUW]

* ECLIPSE IMAGE AVAILABLE VIA FTP *
==========
A collection of images taken of the 10-May-94 annular solar eclipse have been assembled into a single file and is available via anonymous FTP at: ftp.uleth.ca (IP # 142.66.3.29). The image is called "eclipse.gif" and is located in the "pub/solar/Images" directory at this site. The frame contains 24 high-quality images taken by the Big Bear Solar Observatory. All but three are full-disk hydrogen-alpha and Ca II K images, giving excellent views of existing features visible on the Sun (regions of enhanced plage, filaments, etc). The other three images are high-resolution close-up images of the Sun showing craters and mountain ranges against the background of the solar surface. "eclipse.gif" is a large 1500 x 1297 x 256 image that will make good use of large high-resolution monitors.

The folks at the BBSO did a great job capturing these images, and deserve a nice pat on the back for covering the event so well.

"eclipse.gif" is in a semi-permanent state. That is, it will not be removed from the FTP disk for a few months.

For what the ARRL has done lately, 8 cents a day is too much. As for what variable I used... x is as good as y in this case. I should have said 'n' number of people.... but that's life.

>Thanks in advance!

Clay,
Yeah, I just got one and it works great! I really can't compare
it to any of the others, but I'm thrilled with it. Just the ticket for
my mobile use. I tried it at home on a xcvr that does not have a CW
filter and was really impressed with how well it worked for the price.
If your intention is mostly to use it on SSB you will likely not be quite
as impressed however. It does a nice job getting rid of the hetrodynes,
etc, but otherwise it just doesn't do much for that service. That's not
to put it down, 'cause none of them do much more than that actually for
SSB. But since I do a lot of mobile CW I'm lovin' the little thing!

No it doesn't mean that, but it means that the ARRL can further place itself into matters that it has no business being in. And yes, there are individuals at HQ who derive a direct benefit from this. As for slamming no-codes, that's not what any of us have been saying. It's the no-clues that bother us. Why not start a new ucdavis.whining.no-clue.people group? You know, this almost makes me want to resume a UUCP connection again.

2670. Digest of Articles - QST Oct 1993 (Long - 44k)

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-24 14:28:15 UTC
From: wvanho@infinet.com
Message-ID: <2rt2tv$j6g@rigel.infinet.com>
Source record: 266427
Cross-posted to: rec.radio.info,rec.radio.amateur.misc

DIGEST OF ARTICLES -- QST, October, 1993

Following are digests of articles printed in the October, 1993 issue of QST. Such digests are being prepared for each issue of QST, and posted periodically. Subsequent issues will be posted one per week until they "catch up" to the current date in mid-1994, thereafter monthly.

It is hoped that other hams will volunteer to post similar digests of the other ham technical publications such as QEX, CQ, 73, COMMUNICATIONS QUARTERLY, RTTY JOURNAL, et al. Especially desirable would be digests of publications in other countries, such as the RSGB RADIO COMMUNICATIONS and ham magazines in Europe, Japan, Australia, and other countries around the world. We English speakers would especially enjoy them if they were translated into our language, but they would also be valuable additions to the world's knowledge if they were posted in the language of origin. Who knows? Some bi-lingual ham somewhere might translate them into English and re-post them.

Worldwide communications are getting better and better. The time has come to make the world's ham press available to all hams throughout the world!

The major value of digests is to give readers sufficient information to decide whether to obtain a copy of the full text. If any U.S. reader wants a copy of an article in QST, please inquire of other hams in your own neighborhood. Many have collections of back issues. Anyone who is unsuccessful in finding a fellow ham with a collection should try every library in the area, especially those at universities and technical colleges. If all else fails, a copy can be obtained from the ARRL Technical Department, 225 Main St., Newington, CT 06111-1494 USA for a fee of $3.00 per copy. Remember, it is both cheaper and quicker to obtain one locally.

Readers in most other countries can obtain copies from their own national ham organizations, sometimes translated into their own languages.

TECHNICAL ARTICLES (TA)

Title>TA1:The SunSwitch
Author>Bryce, Michael - WB8VGE
Source>QST Oct 93, pp. 24-27
Abstract>Construction article for a controller to regulate the charge current from a bank of solar cells into a battery.

Digest>Mr. Bryce presents a design and construction article for building a charge controller to control the current flow from a bank of solar cells into a battery. It is a smaller and less expensive version of the "FET Charge Controller" that he described in QST, January, 1992.

In operation, the unit measures the state of charge in the battery (by measuring the voltage across its terminals). It turns the current "on" if the charge is low, and keeps it that way until the battery is fully charged. If the solar array is not putting out a high enough voltage, the controller switches it off.

There are three LED indicators on the front panel which show if the battery is charged, charging, or off-line. The unit is designed to handle charging current up to 6 amps, which is enough to handle two 48-watt photovoltaic panels. The current is switched on and off by two power MOSFETs, each rated at 3 amps. If the intended load will not exceed the 3 amp level, one of these can be omitted. Alternatively, the current capacity can be increased up to a total of 14 amps by modifying the circuit board as the author describes in detail in the article.

A complete wiring diagram and parts list is included. A kit of parts, including everything except the enclosure, is available from SunLight Energy Systems, 2225 Mayflower NW, Massilon, OH 44646 for $42.50, including domestic shipping. A p.c. board and parts overlay template are available, for an SASE, from the ARRL Technical Department Secretary, 225 Main Street, Newington, CT 0611.

Title>TA2:Inside the Grounded-Grid Linear Amplifier
Author>Bruene, Warren - W5OLY
Source>QST Oct 93, pp. 28-30
Abstract>The most popular kind of linear amplifier for use on HF bands is the grounded-grid type. This article gives a thorough analysis of vacuum tube operation in this type of circuit.

Digest>The operation of a triode in grounded-grid service can be described by a set of "Anode Current Characteristic Curves". These curves are determined by laboratory measurements of the voltages on the plate and filament, and anode current, under d.c. conditions. They are published by the tube manufacturers.

The article includes a graph of this type for an idealized triode roughly similar to the Eimac 3-500Z. The author shows how this graph can be used to calculate essentially all of the operating characteristics of the amplifier.

His final summary states: "The operating conditions of a grounded-grid linear amplifier are determined by the anode load resistance and

drive-voltage amplitude. The anode load resistance determines the slope of the load line. There is practically no relationship between the correct tube load resistance and the effective internal resistance...of the amplifier."

Title>TA3:TAPR's Digital Deviation Meter
Author>Johnson, Lyle - WA7GXD
Source>QST Oct 93, pp. 31-38
Abstract>An article describing the characteristics of FM signals, including the number and amplitude of sidebands, plus a description of the digital deviation meter developed by the Tucson Amateur Packet Radio club (TAPR).

Digest>Any FM signal, including FSK, contains a carrier and multiple sidebands. If the audio modulation is a single tone, as is the case in a 2200 Hz. AFSK signal, the r.f. will be made up of a carrier plus sidebands, both above and below the carrier frequency, at intervals of 2200 Hz. The total number of sidebands, and their amplitudes, are determined by the amplitude of the modulation.

At the other end of the link, the received signal is filtered by the i.f. bandwidth. If the number of sidebands (the "deviation of the signal") make the signal too wide, the higher-numbered sidebands are cut off. This results in distortion of the received signal. Alternatively, if the deviation is too low, the detected audio may be too weak to override the noise level. Hence, controlling the deviation of an FM transmitter is important, but most hams do not have the equipment necessary to measure it.

Tucson Amateur Packet Radio (TAPR), a non-profit corporation, has developed an inexpensive deviation meter and is making it available in kit form to the ham community. This article is a thorough description of the design and construction of the kit.

The article explains the principle of operation by pointing out that any FM receiver's detector output is a direct measure of deviation. In principle, all one needs to do to measure the deviation is to measure the output voltage. But the rub comes in calibrating the detected voltage in terms of frequency deviation; the calibration may drift over time. TAPR's design solves the problem by building a self-calibrator into the system.

The unit contains an analog FM signal-processing system, an analog-to-digital converter, and a microprocessor. Five times per second, the analog circuit samples the highest and lowest detector voltages, they are digitized, and the difference between them is compared with a table of values stored in the microprocessor's memory. It translates the measured voltage difference into a deviation reading in KHz., accurate to 0.1 KHz.

How does the microprocessor get its table of values? It obtains it automatically, by itself! Every time the power switch is turned on, a calibration oscillator running near the i.f. frequency comes on. It starts at 10 KHz. below the i.f. center frequency and steps at intervals of 1 KHz. to 10 KHz. above the center frequency. At each step, the analog detector voltage is sampled, digitized, and its value held in memory. This assures accuracy of measurement over a reasonable operating time.

The article contains complete wiring diagrams, parts lists, construction hints, and a description of how to hook it into any FM transmitter. A complete kit of parts including a construction and operating manual and software, but not including a case, is available from TAPR, P.O. Box 12925, Tucson, AZ 85732-2925 for under $100. Printed circuit board template is not available from the ARRL.

Title>TA4:Schematics at Your Fingertips
Author>Schofield, Ken - W1RIL
Source>QST Oct 93, pp. 39-40
Abstract>Using WINDOWS PAINTBRUSH to draw electronic schematics on DOS-based computers.

Digest>Many hams now have, or are buying, IBM-compatible computers that use an operating environment called WINDOWS. It comes equipped with a sub-program called PAINTBRUSH. Using PAINTBRUSH, one can draw lines, circles, or any other shape, in full color, on the computer screen.

Mr. Schofield, using WINDOWS PAINTBRUSH, prepared a complete set of electronic circuit symbols, and has them stored in his computer. Using the symbols plus the line-drawing ability of PAINTBRUSH, he can draw electronic circuit diagrams of almost any complexity on his screen. Once it is on the screen, with a dot-matrix- or laser-printer, he can print it on paper. In the article, he explains how he made the symbols and how he uses them to draw diagrams.

The author has made his file of predrawn symbols available for the asking. Anyone with a computer plus modem can call the ARRL telephone Bulletin Board System (BBS) at (203) 666-0578 and download the file into their own computer. Alternatively, send a blank floppy disk (either a 5-1/4" 1.2 MB. disk, or a 3-1/2" disk of either 720 KB. or 1.44 MB. size) in a suitable disk mailer, and enclose return postage, and the file will be mailed.

Title>TA5:The Earth Detunes My Antenna
Author>Hall, Jerry - K1TD
Source>QST Oct 93, pp. 41-44
Abstract>Report of a study of the effects of various types of ground on the resonant frequency of dipoles.

Digest>Most hams realize that the earth has a major influence on the radiation pattern of an antenna, but we tend to forget that its presence

also affects the resonant frequency, as well. Mr. Hall has studied the effects of the ground on a half-wave dipole antenna using NEC2, a method-of-moments computer program. This article contains some of his findings.

Antenna reference books, such as the ARRL Antenna Book, tell us that the end effects in a wire dipole cause a "half-wave" antenna to be physically about 5 percent shorter than a free-space half-wavelength. Thus the common formula usually given for calculating the length of wire is to divide 468 by the frequency in MHz. to get the answer in feet. The author finds that, when modeling a 3.75 MHz. dipole in free space with a length calculated by the formula, the impedance at the center would be 67.5-j41.8 ohms. But this is not resonant since, by definition, at resonance the impedance will be a pure resistance. For resonance, the antenna must be lengthened by about 2.5 percent so the formula becomes 479.6 divided by the frequency in MHz. The center resistance of the antenna at resonance is 72.2 ohms.

The author now brings the earth back into the calculation and models the dipole at 50-feet (15-meters) height over "perfect ground", meaning the approximate equivalent of seawater or an infinite copper plate. The antenna must be shortened so that the proper factor is 469.5 divided by frequency. Shortening the antenna lowers the radiation resistance, which is now 59.6 ohms.

"Real ground", meaning dry land, varies substantially in its characteristics as measured by dielectric constant and conductivity. What is defined, for radio purposes, as "very good land" is the rich soil typical of the area from Dallas, TX to Lincoln, NE; very poor to extremely poor is in the middle of cities, with heavy industrial areas or high buildings.

Analysis of the antenna at 50-feet (15-meters) over soil at the two extremes indicates that for very good ground the factor in the formula should be 470.8, and for poor earth it should be 473.9. For the 80-meter antenna with a total length of about 125 feet (38 meters), the range of differences is only about 10-inches (25 cm.), but that represents the same difference in length as would be caused by a change of frequency of about 25 KHz.

The author goes on to explore the effects at different heights and also studies the effect of ground conditions on the radiation patterns in the elevation plane. In his summary, he acknowledges that his work has simply verified what all hams have known from the beginning, that is that the only way to obtain a resonant antenna is to prune it on-site. But his work does give the reader a better idea of what specific effects are at work.

PRODUCT REVIEW (PR)
conductor: James W. Healy, NJ2L
Sr. Asst. Technical Editor

Title>PR1:AEA PK-900 Multimode Communications Processor
Author>Ford, Steve - WB8IMY
Source>QST Oct 93, pp. 71-73
Abstract>Specifications and operational review of AEA's PK-900 Communications Processor. Performance on VHF Packet is little changed from that of earlier models; but on HF modes, performance is distinctly better.

Digest>AEA, the manufacturer of the Model PK-232, one of the most widely-used multimode communications processors (MCPs), has recently begun to broaden its line with more sophisticated (and expensive) models. Their "high-end" models DSP-2232 and DSP-1232 feature digital signal-processing and a number of other advanced features. The model PK-900 is intermediate with performance features broader than the PK-232, but not up to the high-end models. Its most substantial addition over the PK-232 is the availability of two independent radio ports. One is designed specifically for packet operation while the other supports all the HF digital modes as well as 1200-bit/s VHF packet.

Another major difference is that the PK-900 does not use LED indicators on the front panel. Instead, it has a large, amber liquid-crystal display that reports operating conditions in plain-English words. The lower part of the rectangular display is a 20-bar tuning indicator which can be changed by software commands to several different modes of display. As an optional feature, a 9600-bit/s modem can be added. This allows communications with certain satellites that operate at that data rate.

The author used the PK-900 in all of its different modes and reports that in VHF packet, it is comparable to that of all other modern MCPs that he has used. But on HF digital modes, including packet, AMTOR, PACTOR, RTTY, and CW, its performance is distinctly superior to older models. He gives a number of illustrations of this that he determined by rapidly changing from the PK-900 to his other (unidentified) MCP when operating on HF digital modes under difficult operating conditions of QRM, weak signals, and QRN. In each case, he found the information throughput using the PK-900 to be distinctly faster than with the older model. He attributes some of this improved performance to the 8-pole Chebyshev band-pass filter in the PK-900.

Like the other AEA MCPs, the PK-900 includes the Signal Identification and Acquisition mode (SIAM). Operating in that mode, the unit will automatically identify a signal, if it corresponds to any of the types that have been included in the unit's software. When it does, it will switch its mode to correspond to that of the received signal.

The author reports in his final summary that, for the advanced digital-mode enthusiast, the PK-900's extensive standard-feature set and optional support of 9600-bit/s operation raise its value, but it is

overkill for more pedestrian applications.

Title>PR2:Ramsey Electronics FX-146 2-Meter Transceiver Kit
Author>Bloom, Jon - KE3Z
Source>QST Oct 93, pp. 73-74
Abstract>Description of the Ramsey FX-146 2-Meter Transceiver built from a kit. Its performance is sufficient to let the builder "get on the air", but not up to the standards of commercially-built equipment.

Digest>Among the electronic kits that Ramsey offers are test equipment and general hobby-electronic items, plus several amateur products. One is the FX-146 2-meter FM transceiver. It covers 140-180 MHz. in 12 discrete channels, selected by a 12-position switch. The local oscillator is synthesized and the 12 channels are selected and hard-wired during assembly.

The front panel has only two knobs, Volume and Squelch, the 12-position switch, an LED indicator that signals when the unit is transmitting, and two jacks for microphone and speaker. The jacks are spaced so that they will accept an ICOM-compatible speaker/microphone accessory plug.

The reviewer built a unit following directions in the manual. They instruct the builder to proceed one sub-section at a time and not to continue until each is operating properly. His opinion is that the manual and instructions are "pretty good" but inexperienced builders may want some help from more experienced hams.

The completed transceiver performs with acceptable sensitivity but with limited dynamic range. Its front-end filtering has a broad band-width which allows it to be used for receiving information and commercial frequencies but leaves it open to interference caused by intermodulation distortion and also by images.

The reviewer's final summary was: "Inexpensive and relatively easy to build, the FX-146 will get you on the air, but with less than factory-built performance."

HINTS AND KINKS (HK)
conductor: David Newkirk, WJ1Z
Sr. Asst. Technical Editor

Title>HK1:More on Coax-Cable Connector Installation
Author>Collins, Lewis D. - W1GXT
Source>QST Oct 93, p. 75
Abstract>One ham's opinion of the best way to attach PL-259 plugs onto coax cable.

Digest>The writer offers some hints about the best and most reliable way of soldering PL-259 plugs on the ends of coax cable. His approach is similar to the instructions that are printed in common amateur

literature with two exceptions:

First, he strongly advises the use of a 100-watt soldering iron such as the American Beauty Model 3138. The editor interjects a note that such irons are routinely used by stained-glass artists. Anyone who has difficulty finding one for sale in electrical/electronic outlets should check the Yellow Pages under "Craft Supplies" and "Glass-Stained and Leaded".

Second, he suggests the plastic outer sheath as well the dielectric be cut with a dull knife so that it will be less likely to nick the braid or conductor underneath it.

He advises the following steps:

1. Remove 3/4" of outer sheath without nicking the braid.

2. Using the soldering iron, quickly tin the braid for at least 3/8" starting at the end of the outer sheath.

3. File the solder on the braid to a uniform thickness.

4. Using the dull knife, (better yet, a tubing cutter), cut through the tinned braid and part way through the dielectric, 5/16" from the end of the jacket. Be careful not to nick the center conductor.

5. Grasp the small piece of dielectric that is not completely cut off and twist it with pliers back and forth to break it loose along the cut.

6. Put the connector on the end, solder to the braid through the four holes around the connector, and solder the center conductor in the center pin. Snip off any excess length of center conductor that protrudes through the pin.

Title>HK2:Curing VU-Meter Pinning in the MFJ-624D Hybrid Phone Patch
Author>Stauffer, Bill - W5ICV
Source>QST Oct 93, pp. 75-76
Abstract>Overcoming a deficiency in the MFJ-624D phone patch that caused the meter to indicate full-scale whenever the phone line was connected.

Digest:The writer describes a problem with his MFJ-624D phone patch. When he installed it according to instructions in the MFJ manual, the patch operated properly except that its VU-meter pegged when the phone line was connected. He investigated and discovered what the problem was. He fixed it by installing a 600-ohm isolation transformer obtained from Mouser Electronics.

With the letter, he includes a wiring diagram and a dimensioned drawing of a small piece of perf-board, indicating where the invidual components should be mounted for installation inside the cabinet of the MFJ unit. He invites anyone with further questions to contact him at Rio Rancho,

NM, (505) 891-8746.

Title>HK3:The Multi-Tuner
Author>Wilson, Curtis - W0KKQ
Source>QST Oct 93, p. 76
Abstract>Combining three antenna tuners into one assembly, used with three antennas.

Digest:The writer uses several antennas for receiving and transmitting on a single band, and finds it helpful to be able to switch rapidly from one to another. A simple selector switch is not enough because each of his antennas must be tuned, using an antenna tuner. His solution is to have three antenna tuners, one for each antenna so that each is always tuned and can be instantly switched.

He strapped MFJ Model 948 Deluxe Versa Tuner II antenna tuners together with aluminum straps, and interconnected them with short coax jumpers. He shows a block diagram indicating the electrical interconnections amd a pictorial diagram showing the three tuners mounted one atop the next.

TECHNICAL CORRESPONDENCE (TC)
conductor: Paul Pagel, N1FB
Associate Technical Editor

Title>TC1:Sense the Right Way to Go With the HANDI-Finder
Author>Moell, Joe - K0OV
Source>QST Oct 93, pp. 77-78
Abstract>Adding a delay line to the HANDI-Finder to convert the "figure 8" to a cardioid (i.e. heart-shaped) pattern.

Digest:The writer offers a modification to the "HANDI-Finder" described by B. Leskovec: "Build the HANDI-Finder!" in QST, May, 1993, pp. 35-38. The writer has found the HANDI-Finder to be an admirable unit for "Fox-Hunting" except for the fact that its null is bi-directional. Mr. Moell offers a simple modification that converts the original "Figure 8" to a "cardioid" pattern with a single null.

The modification requires inserting a carefully trimmed piece of miniature coax as a delay line in the lead to one of the two antennas. His letter gives detailed instruction as to how the delay line should be dimensioned and trimmed, where in the circuit it is to be inserted, and how it is to be physically mounted on the circuit board of the HANDI-Finder. He also shows photographs of both sides of the circuit board with the jumper installed.

He reports that the operation is very effective in giving an unambiguous reading of direction in "Fox-Hunting". Its only drawback is that the unit is no longer usable over many bands; the delay line must be cut for an individual band and will only perform on that band.

LAB NOTES (LN)
conductor: Steve Ford, WB8IMY
Asst. Technical Editor

Title>LN1:Printed-Circuit Board Circus
Author>Ford, Steve - WB8IMY
Source>QST Oct 93, pp. 79-80
Abstract>Preparing PC-boards at home.

Digest>Mr. Ford presents a simulated question-and-answer series that explains how printed circuits can be obtained for people interested in building electronic projects. He mentions that many projects written up in hobby electronics and amateur radio publications contain printed circuit patterns and, often, indicate sources where etched and drilled boards can be obtained. He then goes on to explain how people who are unable or unwilling to buy etched boards can design an etch their own.

He explains how to prepare boards for etching by applying wiring patterns through direct drawing by special resist-pens, by pressure-sensitive tape, or by dry transfer of patterns. He also explains the photo process by which printed circuit patterns can be applied via a photo-sensitive coating and photographic printing techniques onto the copper. Finally, he explains the etching process using a corrosive chemical, usually ferric chloride.

Finally, he gives the names and addresses of several sources where appropriate supplies can be obtained, including Radio Shack as well as more specialized suppliers.

NEW HAM COMPANION (NHC)

This Section is a standard monthly feature of QST. It contains articles of primary interest to newcomers to amateur radio.

Title>NHC1:Mountain-Top VHF Operating: A New Adventure!
Author>Putman, Pete - KT2B
Source>QST Oct 93, pp. 60-62
Abstract>Operating in the VHF QSO Party from a peak in the Kittatiny Mountains using gear for 3 bands back-packed to the top.

Digest:The author relates his experiences during the June, 1993 VHF QSO Party when he carried three transceivers and three antennas to the top of a peak in the Kittatiny Mountains of northwestern New Jersey at an elevation of 1500-feet above sea level. He had to carry the equipment on his back for about 2-miles up a part of the Appalachian Trail from a parking area. The site is the base of a state fire tower and it gave him access to the densely populated East Coast concentration of UHF/VHF activity.

His transceivers covered 6-meters, 2-meters, and 70-centimeters, each running 3-watts output. He also carried an electronic keyer which he

had modified by mounting two push-button switches in the top cover. He uses them in lieu of a paddle while sending CW. His antennas were a 5-element Yagi on 6-meters and two 9-element Yagis on the other two bands.

He operated for 4-hours and made 85 contacts in more than 36 grid-squares. Of the total, 26 contacts were made on 6-meters in 12 grid-squares; on 2-meters there were 39 contacts in 13 squares; and on 70-centimeters, 20 contacts in 11 squares. Almost all contacts were using SSB and CW.

Title>NHC2:Nobody Talks to Me!
Author>Ford, Steve - WB8IMY
Source>QST Oct 93, p. 63
Abstract>How a beginner can "break the ice" and have QSOs on VHF/UHF bands.

Digest>Mr. Ford addresses the problem facing newcomers to the VHF/UHF bands who find it difficult to open a QSO with another ham. On repeaters, it is not the custom to call "CQ". Instead, custom dictates that one announces their presence by giving their call sign followed with the word "Listening!" Often, other hams who are monitoring the repeater do not take that as a request for a QSO, hence do not reply.

The author gives a number of suggestions of how to open conversations, meet people, and form a circle of friends. He points out that many hams who spend time on VHF are basically shy and feel slightly uncomfortable talking with strangers. But they usually will welcome requests for information and advice from newcomers, so that offers the possibility of opening initial contacts.

Title>NHC3:Stalking the Fox
Author>Kearman, Jim - KR1S
Source>QST Oct 93, pp. 64-65
Abstract>Describing amateur "Fox Hunts", i.e. using radio direction-finding gear to locate hidden transmitters as a competitive activity.

Digest>Mr. Kearman describes the sport of "Fox Hunting" or "T-Hunting". It is the game of hide-and-seek conducted on radio! A hidden transmitter, usually on the 2-meter band, is hidden somewhere and hams with various kinds of direction-finding equipment try to find it. The article discusses kinds of equipment suitable for use and ways of organizing hunts.

Title>NHC4:The First Contest
Author>Cotterman, Charlie - KA8OQF
Source>QST Oct 93, p. 66
Abstract>Getting started in ham radio contests.

Digest:The author tells his personal experiences during his first ham radio contest. He made many mistakes and got only a very low score, but he realized that: "Everyone's got to start somewhere." He did, and presumably is, by now, an experienced contester.

Title>NHC5:LOWfing on 1750 Meters
Author>Ford, Steve - WB8IMY
Source>QST Oct 93, pp. 67-68
Abstract>Operating in the 160-190 KHz. band.

Digest>There is a radio band at frequencies between 160 and 190 KHz. that is open to everyone with no license required. It is not a very popular band because there are severe restrictions on the kind of equipment that may be used. First, the power input to the final amplifier must not exceed 1-watt. Second, the antenna, including transmission line, must not exceed 15 meters in length (about 50 feet). Nevertheless, there are some amateurs who are experimenting and making contacts over respectable distances.

More information can be obtained from: The Longwave Club of America, 45 Wildflower Rd., Levittown, PA 19057

Title>NHC6:The Doctor is IN
Author>Various
Source>QST Oct 93, pp. 69-70
Abstract>A regular monthly feature in this section, it is devoted to questions and answers of interest to newcomers.

Digest>This month the questions discussed had to do with: electronic keyers; calling CQ on the 80- or 160-meter bands; a problem with the volume control on an HT transceiver; the legality of using two-letter abbreviations of call-signs during DX-net operations; accidental activation of the autopatch on a repeater; RFI on a transceiver caused by a computer; and plugging accessory boards into expansion slots in computers.

RADIO TIPS (RT)

These are short items, scattered among the articles in the NEW HAM COMPANION section.

Title>RT1:The Right Polarization for the Job
Author>Ford, Steve - WB8IMY
Source>QST Oct 93, p. 62
Abstract>In VHF and UHF operation, antenna polarization is usually horizontal in SSB and CW work, vertical in FM.

Title>RT2:Using an Autopatch to Report an Accident
Author>Regent, Richard - K9GDF

Source>QST Oct 93, p. 65
Abstract>Instructions for reporting accidents via mobile radio by using the telephone 911 through an autopatch.

Digest>If one comes upon an accident, report it via radio in this manner. Get on the air, give yor call sign, and announce "Emergency patch". That gives you priority.

Dial the access code, followed by "911". Tell the dispatcher who answers that you are a radio amateur reporting an accident; then give the exact location, extent of injuries, if any, whether there is a fire, or a spill of fuel or liquids, and whether traffic is blocked. Then sign off but continue to monitor the frequency.

Title>RT3:SWR
Author>Schetgen, Robert - KU7G
Source>QST Oct 93, p. 70
Abstract>A primer on SWR: what it is, its effects, and how it can be monitored and/or reduced.

GENERAL INTEREST ARTICLES (GI)

Title>GI1:VP2MFA "Do-able" DXpedition
Author>Stephens, Stu - K8SJ/VP2MFA
Source>QST Oct 93, pp. 21-23
Abstract>Recounting a "DXpedition" in the luxurious surroundings of a resort hotel on the Caribbean island of Montserrat.

Digest>Mr. Stephens describes a holiday that he and his family took to the Caribbean island of Montserrat. He selected that island after reading the Sierra Club Guide to the Caribbean. From the ARRL he received the Reciprocal Licensing/VP2M Packet and learned that visiting hams are welcomed to the island. He had no difficulty obtaining a license to operate as VP2MFA.

He carried with him on the trip his HF transceiver, which has a built-in power supply and keyer, and his antenna tuner. In addition, he took a 30-foot mast that he made from a collapsible TV-antenna tripod and sections of TV-mast tubing and smaller diameter conduit which would telescope with the mast tubing. He also carried antenna wire, twin-lead, and coax to cover whatever contingencies might arise in getting an antenna up in the air. The antenna parts fit into a ski-bag, which he characterized as "a familiar sight to Customs and Air Line clerks...."

When he arrived, he found that the apartment that they had rented opened onto a court where he erected his mast and put up a 100-foot long inverted vee that he could use on all bands.

He enjoyed acting as a highly desirable DX station that created "instant pileups" when he came on the air. Operating 3- or 4-hours per day, during the two weeks' vacation he logged 3,073 QSOs. His biggest

surprise was 80-meter European DX that came on after midnight, local time. He reported that they provided "the few truly monster pileups".

Title>GI2:Yagi: The Man and His Antenna
Author>Welsh, Robert H.
Source>QST Oct 93, pp. 45-47
Abstract>The story of the invention and development of the "Yagi" (more properly the "Yagi-Uda", or perhaps just the "Uda") antenna.

Digest>All hams today know what a Yagi antenna is, but many may not know how it got its name. Mr. Welsh tells the story of Hidetsugu Yagi and Shintaro Uda, the two Japanese engineering professors who were responsible for the development of the antenna.

In the west, and especially in the United States, we are very careful to credit a discovery or invention to the person who actually conceived the idea and/or did the work. In some other countries, notably in Japan, the teacher or mentor of a researcher is often given the major credit for what his pupil discovers. Professor Yagi was a senior professor at Tohoku University in Japan, and Assistant Professor Uda was a younger man working under Yagi's supervision.

Uda conceived the idea of placing parasitic elements near a dipole radiator and discovered that making them slightly longer caused them to act as reflectors; slightly shorter, as directors. Working in the University laboratory, he made careful measurements with numbers of elements. From that, he obtained the complete engineering data regarding the design of antennas with one reflector and any number of directors, exactly as they are built today. Professor Yagi, in his subsequent publications and speeches always credited his young assistant with having made the actual discovery.

The first published article describing Uda's work appeared under his own name in the Proceedings of the Imperial Academy of Japan in February, 1926. The first publication in the United States was written by Uda in the Proceedings of the IRE in March, 1927. But Yagi applied for the Japanese patent December 28, 1925, and for a U.S. patent in September, 1926. Yagi's American patent was issued in May, 1932 as U.S. Patent Number 1,860,213. Now it is Yagi's name that is most commonly used to identify the antenna.

The author points out the surprising fact that hams paid little attention to the antenna until near the end of the 1930's. By then, the popularity of the W8JK wire beam had wakened the interest of hams to beam antennas, in general. But it was the advent of television immediately before, and especially after, World War 2 that made Yagi-Uda antennas the most popular of all antenna types.

Title>GI3:The Radio Clubs of Romania
Author>Pataki, George - WB2AQC, ex-YO2BO

Source>QST Oct 93, pp. 48-50
Abstract>Amateur radio in Romania has emerged from the former tight government control and is burgeoning. The radio clubs that formerly were used by the government to exert control now are free and are encouraging more young people to join in the fun.

Digest>The author, who was born in Romania, visited his native country in 1993 and reports the current status of ham-radio there. Prior to the 1989 overthrow of the former Communist dictatorship, all amateur radio activities were closely controlled by the government. But they did actively encourage and sponsor a great number of radio clubs, completely paid for by the government. Now, most of these clubs still exist and are owned by county governments, manufacturing companies, schools, and other organizations. There are not many amateur stations in private homes.

The author feels that ham radio, like the whole country, is going through a period of transition. A great many enthusiastic hams are there, and purely private ham activities will inevitably grow as the economic condition of the country develops.

Title>GI4:How to Be a DXer
Author>Mastroianni, Joe - AA6YD
Source>QST Oct 93, pp. 51-52
Abstract>Humorous recounting of a bad case of DXing "disease".

Digest>This is a tongue-in-cheek article that explains that DXing is a disease that is nearly incurable. He relates how he allowed himself to be drawn into pileups, what an effect it has had on his family life, and how he has been driven to seek counsel from a "shrink".

Title>GI4:Hams Test Antennas Aboard Space Shuttle COLUMBIA
Author>Siwiak, Kai - KE4PT
Source>QST Oct 93, pp. 53-55
Abstract>Amateur radio aboard the space shuttle COLUMBIA.

Digest>In April, 1993, the space shuttle COLUMBIA went into space on mission STS-55. It carried two complete amateur radio stations, one in the orbiter itself and the other in the German Space Lab, which was carried in the shuttle's cargo bay. The one in the shuttle was called SAREX (for Shuttle Amateur Radio EXperiment) and the one in the Lab SAFEX.

Before the mission, arrangements were made by the ARRL, NASA, the Motorola Amateur Radio Club in Plantation, Florida, the IBM Radio Club in Boca Raton, Florida, and a number of indidual hams, to perform a controlled experiment. The goal was to make accurate measurements of the signal levels on the 2-meter band received from both transmitters through the duration of two passes over Florida.

The SAREX antenna was mounted on the window of the shuttle, whereas the German Space Lab carried an external antenna. The author does not describe either antenna, but the reader must assume that the antenna attached to the window was some kind of a dipole and the SAFEX external antenna some kind of a beam.

In contrast to the lack of any specifications for the antennas in orbit, the antennas on the ground are described in great detail. The IBM and Motorola clubs built elaborate receiving antennas and signal-reception data were carefully recorded with both vertical and horizontal polarization.

Signal levels have been calculated from the accumulated data and the article includes plots showing received signal strength of both polarities second-by-second for the entire duration of two successive orbital passes. From the data, the directive gain of both transmitting antennas were calculated and also plotted.

The indicated gain of both antennas changed substantially over the duration of the pass due to changes in ground reflectivity from different elevation angles of the shuttle seen from the ground. The calculation shows that the SAFEX antenna outperformed the SAREX antenna by about 11 dB. The peak absolute gain shown by the SAFEX antenna is about 6 dBi. and that of the SAREX approximately minus 7 dBi., both within an estimated accuracy of plus or minus 5 dB.

2671. Amp-Hours for a Battery

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-24 14:33:35 UTC
From: mam@cbnewsg.cb.att.com
Message-ID: <CqB9s0.uH@cbfsb.cb.att.com>
Source record: 266303

How can I determine the 'Amp-Hour' of a battery?

I got some neat 6v no-maintenance batteries at the local Hamfest.
They charge fine, and have the appropriate 6 volts. But If they
say NP10-6 (or is it 6-10) 10 Amp-hour, how can I test that?

And how do you test for a charged battery? I set my Multimeter
to 10Amp, and touch the probes to the + and - of the battery. (I hope
I haven't been doing -The Wrong Thing-!)

Thanks,

--Mark KB2els

: Mike, N4PDY

These antennas (at least the Larson Glass Mount) are fine business in my opinion. As I previously stated, it really depends on the tinting material used in the glass. If you have tinted glass, it might be wise to check with the antenna mfg first. Mine worked on my Ford Pickup with non-tinted glass as well as my 5/8 mag mount. When I transferred it to my Explored that has some sort of tinting at the top part of the glass, it didn't work nearly as well (ie 2.3:1 vs 1.2:1 on the pickemup). It is worth the effort to check on the glass, IMHO, because there is no drilling and it provides a sanitary installation.

2674. IDing

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-24 16:18:57 UTC
From: derry@NeXTwork.Rose-Hulman.Edu
Message-ID: <2rt9dh$46r@master.cs.rose-hulman.edu>
Source record: 266327

To the whole bunch of people..

As I listen to emergency nets and participate in amateurs assisting various
special event holding groups in the area, it's easy to see that hams must
really like the sound of their call letters. It's not uncommon for one to
give his call two or three times in one 30-second transmission.

This is extremely inefficient and time consuming. Once per 10 minutes is
all that's required and all that's needed in most cases. When operating
under emergency conditions, efficiency of operation is essential.

Here's the way it usually sounds. These are all fake calls. (I think).
(NCS is IM4IU).

IM4IU: AZ9FCC, this is IM4IU.

AZ9FCC: IM4IU, AZ9FCC. Go ahead.

IM4IU: AZ9FCC, IM4IU. Call H73OM with the information. IM4IU out.

AZ9FCC: Roger IM4IU, AZ9FCC. H73OM, this is AZ9FCC. How copy?

H73OM: AZ9FCC, this is H73OM. I copy okay, pass your traffic. H73OM, over.

AZ9FCC: This is AZ9FCC. The Race coordinator wants you to let him know
when number 45 passes your checkpoint. H73OM, AZ9FCC.

H73OM: AZ9FCC this is H73OM. Roger. I'll pass the info along. Back to

net control. IM4IU this is H73OM.

IM4IU: H73OM this is IM4IU. Good job, thanks. This is IM4IU for I. D.

...and on and on and on and on and on...

A much better way to do this is to call the net members by their first names
or by a number or by their position along the course (or equivalent). This is known as using "tactical callsigns". For example: "Red Cross this is Community Hospital". Then the NCS can remind each station to ID on ten-minute intervals.

Another bad habit is "This is AR1RL for ID". Does anyone know why people say this? Also there seems to be a growing trend to say call letters instead of saying "over" or "go ahead". Some amateurs say their call

letters at the end of each transmission.

Use of Q signals on phone doesn't make much sense either. Better to use JUST PLAIN ENGLISH, or whatever you speak wherever you live. It takes more effort and time to say "QSL" than "roger". Also, if you say "What is your QTH?", what you are saying is "What is your what is your QTH?".

Finally, every amateur should learn the standard phonetics and use them no

more than necessary.

K9CUN thus is KILO NINE CHARLEY UNIFORM NOVEMBER, not KNEECAP NINE CIPHER UNDERWEAR NOODLEHEAD.

The habits an amateur acquires when not participating in net operation will undoubtedly carry over to those times when quickness and efficiency are of utmost importance.

73 es cul de K9CUN (for ID!)

WJS@MAINE.MAINE.EDU (K1AG) says:

>Today's the day it all began. One hundred fifty years ago today,
>March 24, 1844 Samuel F.B. Morse sat at a table in the US Capitol
>building in Washington and sent the first public telegraph message
>to his assistant, Alfred Vail, in Baltimore. Morse's first message
>-- What hath God wrought -- opened the age of electronic communications.

You mean he didn't say "QRZ the Line!" first?

Vail apparently replied "Go away, I have been using this line for the
last 3 hrs and I always use it at this time of day, find another one,
you jerk".

Morse not only gave us his (or somebody else's) code, but his middle
initials (F.B.) are constantly used as a greeting among hams (or is
it HAMs) worldwide, in his memory.

CENTRAL GEORGIA NATIONAL HAMFEST
PERRY, GEORGIA
August 6, 1994
0800-1500

Now is the time to begin planning to attend the Central Georgia National Hamfest at Perry, GA, on August 6, 1994. The hamfest will be held at the Georgia National Fairgrounds, right off I-75, exit 42.

Activities include:

** The Boatanchor Forum.

** A Repeater Forum.

** How to become a Ham Forum.

VEC testing will be conducted. Walkins accepted.

Dealer spaces are available inside.

A large Bone Yard space, right outside the main building, is available for FREE!

Refreshments available at the hamfest.

Lodging is available in the immediate vicinity of the hamfest.

Talk in: 146.25/85

If you would like more information, please contact

Larry Keith, KQ4BY
231 Shenandoah Trail
Warner Robins, GA 31088-6289

Message-ID: <slayCqBHEJ.5Kx@netcom.com>
Source record: 266279

: we had a guy at our test session this past weekend who refused to
: sign the 610 because of the wording of the certification that all
: the info was correct, etc. etc. We told him the FCC probably wouldn't
: accept the form without a signature and the guy got all steamed
: about his rights, etc etc. He got real belligerent and
: disruptive so we asked him to leave.

Hmmmm, I wonder if the guy also refuses to sign is Form 1040 for the
IRS every year as well. ;-) Sounds like a nut.

Aother Story:

This one isn't about weirdos or any thing .... but at a test session
some time ago, there was an 83 year-old ham who came in to sit for
his 20 wpm cw test. The "lead" CW examiner was actually a "neighbor"
of his. Anyway, the old fellow was very nervous and used a combination
of cursive and printed characters in his writing. He passed only
6 of the 10 questions, so I sat down and counted letters. His writing
was pretty awful, but the "third" CW VE and I went thru letter-by-
letter and counted them. It wasn't easy .... but we counted something
like 120 letters in a row. Unfortunately, the "lead" VE could not
make the same count ... nor were two other VEs who were called over
to look at the handwritten copy. So, now we had 5 VEs, with the
first two saying "yes" and the other three saying "no".

The key problem came down to a word like "KLM" or something.
He had even re-written the word to "try" and make it clearer - but...
The "three 'no' VEs" said he had printed a "KLK". I said -
no way BECAUSE - the two supposed "K"s didn't look like each
other. I explained that a "K" is written with only 3 strokes
of the pen - using shapes like: | / \ and the letter
"M" MUST have 4 strokes of the pen (which the examinee did have)
using: | \ / |.

Anyway, the VE coordinater refused and had the three "NO" VEs take
responsibility for the examinee's 610. After the session, I
wrote a letter to the VEC and explained my contention
that the examinee had actually "passed" and that his written
copy should be reviewed again ... using my argument of the
3 versus 4 strokes of the pen to make an "M".

Bottom line .... the VEC came back and "recommended" that the
old fellow had indeed passed and that the original "third"
VE and the two of us who said "yes" should sign off on his
CSCE. We did and it all worked out for the best.

Actually, it may be possible that the examinee, due to his advanced years (much less his nervousness) may not have been able to write "clearly" as demanded by some of the VEs.
I almost wondered if that guy would have had a case for an age-discrimination lawsuit (arrghhhh). Anyway, alls well that ends well.

Well I have one by Lakeview (Ham Sticks People). Easiest thing to mount, and comes with the wrench and a plastic alignment tool.. in case you need them. The quality of the materials is EXCELLENT.. the antenna works VERY well.. blows the doors off the 1/4 wave mag mount I have been using. I checked the SWR.. almost 1:1 on most of the repeater I use.. and the worst at the bottom edge was 1.1:1.

The SWR readings were with NO TUNING... just stuck the antenna on...

Gary-

At first, my observations were similar to yours. But after playing with it for a while, I found that up to 50% of people's voices are too monotonous, and get partially nulled-out as if they were heterodynes!

I wonder if the operating instructions might be in error. For example, audio output has a rating that should drive a loudspeaker in the mobile environment. However, when the input level is adjusted down so the red light blinks, maximum output level is barely adequate.

Considering the cost of some of the other DSP units, I suppose the RS unit is worth the price. However, I consider it strictly "first generation". If we are very lucky, a second generation DSP chip will soon be available to plug right in.

Hello everyone! I am thinking about Field Day comming up and I have a few ???'s. I have been into ham radio for 4 months with my general class license. I have a Yaesu FT301AD and I was thinking about running my own FD site.

The problem is that I can't afford a generator, and I have verry little experience with putting antennas up in the middle of a field or what ever the terrain may be.

I have a 100' long wire, a 10 meter vertical (converted 11m vert), and soon to be 20m dipole. And a MFJ tuner.

I have thought of running my rig with the car bateries, just plop the radio in the right seat. (But remaining in the same spot at all times).

Would the car approach work or would the 15 amp radio suck my battery dry in no time? PLEASE HELP! I really want to go for some real points, and I personally think comercial power is not as challenging.

TRL> Thanks for reading this message.
TRL> I am planning a trip to Thailand, and I wonder how it
TRL> is to get a licence to operate there.

My dad lives in Thailand and I'll be going there this summer. From what I've seen so far, the Thai's are REALLY in to ham radio. Especially 2M and other low bands. VHF antennas are even more numerous there than cellular phone antennas are here. It was unfortunate that I didn't take my radio and listen in to what was going on, so I'm not sure if it's organized, or if it's just like CB. What I would suggest for getting a license there is to get a hold of a Thai consulate near you and ask for information, or if they don't know anything about it, ask if there's someplace in Thailand you can get a hold of.. Good Luck..

TP> Oh please, if you want to do "Smokey Reports" keep it on 11m. We don't

IMO, stating that a cop is in a radar trap isn't a "Smokey Report."
It's part of a legal conversation between two ham operators that have
the right to say whatever they want that's legal. Wouldn't a "Smokey
Report" constitute a ham getting on the air and stating for the general
public that a cop is trapping people? That's a one-way communication,
which is against regulations. But no one's forcing you to listen to
a QSO.

TP> need traffic advisories on the amateur bands.

I thought one thing they taught was to free the bands for mobile
operations during rush hours for drivers to inform of conditions..

>dry in no time? PLEASE HELP!

Why on EARTH do you need to run 100 watts? You get 1 or 2 points for over 150 watts, 2 or 4 for 6-150 watts, and 5 or 10 for <5 watts. I find it a heck of a lot more challenging to run 5 watts and see just what I can do. And the installation of antennas in a tree is what it's really about. Remove your car battery, take the radio off somewhere, put up a tent, throw up the antennas, and have a good time (maybe good to not be alone, as well).

I managed roughly 130 QSO's (all but 5 on CW) last year and got 1300+ points out of it. At the 100 watt level, you'd need 325 Q's to get the same point total. And nearly 100% of my operation was on 80 meters, as I hadn't cut a dipole for 20 (but I will this year).

YES, 15 amps will NOT do well for your car battery. But run QRP, and your fresh car battery might just get you through the whole 24-hour period. You'd be surprised just what an effect a good antenna system can have.

The U of MD club (W3EAX) used to do FD's with a vengeance. We mounted tribanders on a couple of really big (100') light towers in this public park that allowed us to stay overnight. And then we built this 80m log periodic, with something like 22 elements (never got it to work, though). But it was sure a lot of fun running the pileups on 15 and 20 on just 5 watts (i.e. we WERE the station people were piling up FOR!), and to just hear the reaction when we said we were running 5 watts to a tribander at 100 feet...

That was the year I worked Hawaii on 15 CW around 8 p.m. local time. Boy, was that fun.

Sorry for the ill-placed posting but this is a hot button for me...

In Denver a couple of years ago a woman did just this, was cited, and I believe the ACLU participated in her defense ("improper use of lights" or some such weasel-wording). She won; the judge said the rule didn't apply to this kind of situation. Don't know if the nazis appealed.
Yes we have more than our share of "speed trap ahead run by local parasites".

Hmmm, I've always wondered if it is absolutely necessary to id every 10 minutes if you are in a roundtable with 5 or 6 or more people and not saying much. My policy is, if I don't normally say alot in the rt, is to say my call discretely on the end of every transmission. It usually ends up happening anyhow, especially if you say something directed to a specific individual. 73

2697. CB/HAM radio interference on phone lines

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-24 21:28:20 UTC
From: gad@fncrd7.fnal.gov
Message-ID: <2rtrhl$smg@fnnews.fnal.gov>
Source record: 266471

Hope some one can help out there :)

I have three people in the neighborhood that are running CB's or HAM radios.
When these people are transmitting they walk all over the phone lines,
Stereo equipment, TV, and baby monitor.

I've called the phone company, cable company, and FCC. The phone and cable
company's say not our problems !!! I have disconnected the phone line coming
into the house, and put a phone on the line that comes in the house. I
still get interference !!! All the phone company said at that was "If you
mess up your phone lines, we'll have to charge you to fix it".
The FCC has been next to useless. It took days to just get ahold of a person,
then he says call your phone company and hangs up !!!

Now my question, is there any kind of filter I can buy to put on my phone
line that will filter that junk out ??? I run a modem from time to time,
so it can't screw with that. I can live with the TV and stereo interference,
but my phone is totally useless when they are transmitting.

Any help at all short of blowing up their transmitters is welcome :)

Please EMAIL to the addr listed below, don't read this group very often.

Thanks...

JM>#1) how does a thru the glass 2 meter antenna actually work?
JM>#2) what are its disadvantages?

There is a very nice article on building a through the glass antenna in the 1994 ARRL Handbook (and earlier versions as well). It should answer all your questions.

Youthnet NEWS 002
5/24/94
Alexis Leynes N9KYJ
Jennie Finch N9SAK

Well, the Dayton Hamvention 94 came and gone, thousands of hams came from all over the world to this hamfest of 100 acres. Not only they found themselves in a mist of bargains but also, they found themselves a bit wet. Rain once again had his this years Hamvention for all of three days. Just for your information, DARA staff do not use the term rain, but instead call it liquid sunshine (It might Jinx them). I asked other hams around why they go to the Dayton Hamvention, and most of them responded that they came for the bargains; others told me that they came for the forums. This years forums were a big success. At the SAREX (Shuttle Amateur Radio Experiment), where astronauts connect via ham radio to classrooms around the world, 10th anniversary forum, the astronauts who participated in this project showed up. Among them were Anthony England W0ORE, and Steven R. Nagel N5RAW. Also at the Youth Forum there were 11 special young hams selected over the past few months by Carole Perry WB2MGP. These were Seth Wilson N0URQ, he talked about his experiences in helping other young people in passing the Novice theory, Cathy Gilliland KB0FDU told us about her demonstration of ham radio in the class room, Lee DeSheild KD4QBW Shawn Pattison KD4WXY, Cody Haley KB5WYJ and Casey Haley KB5UEO were second time invited forum speakers, Chris Rismiller N8PEM, Ray Glzer AA8MR, he talked about balloon ATV and fox hunting, Kevin Sill N9RPL, he talked about ham radio and disaster services, Laura Sobon KD4OZC, she talked about her work in disaster relief at the Mid-West flood and Toby Metz KB7UIM. Other speakers were Roy Neal K6DUE, Chris Lougee N7TJM and Gordon West WB6NOA.
During this years youth forum, Carole Perry WB2MGP wasn't able to make in person, but the DARA (Dayton Amateur Radio Association) was able to contact Carole on her way home from the hospital, and via the phone, she welcomed everyone to the forum. I talked to her on the phone last week, and she told me that she was doing fine, and she thanks the many people who signed her get well card at the forum, and to the others who mailed there own get well card. If you would like to send her a card, address it to:
Carole Perry WB2MGP, 10 BERGLUND AVE, STATEN ISLAND, NY 10314.
While on the topic on youth forums, Rosalie White, sent me more information about youth forums to be held around the country:
June 4, at 1:00 p.m. at the Sea Pac Amateur Radio Convention, at

the Sea side convention center, and on June 11, at noon to 5 p.m. at the Arlington Center in Arlington TX at the ARRL National Convention.
While at the Hamvention, I talked to DARA's Press Officer Scott Allen (still studying for a license). He told me that next years Hamvention will be better than this years. More news about Hamvention improvements as news comes along.
On the first Friday night of the Hamvention at 2000 EST I held the first Youth net at the Hamvention on the Miami Valley FM Association Repeater with a topic of what brings you to Dayton. Due to the little publicity it received, I only had 12 check ins. I would like to thank John AG9V, Dave N8NPX and the Miami Valley FM Association for letting me use their repeater. I hope next year, there will be more check ins and more participants.
Finally, I talked to workers at the American Radio Relay League booth at the Hamvention. They told me that the ARRL is trying out new programs geared to youths. Rosalie White (Education specialist at ARRL) told me that there are a few programs for the young ham. Just contact your local section manager or Rosalie White at the ARRL at 16 Main st. Newington CT 06111 for more information. I'll keep you posted.
If you would like to contribute to Youthnet NEWS, please send me a message to our e-mail or BBS address.

Future editions of Youthnet NEWS would be:

I suppose even if the farmer posted "Please obey strictly enforced
speed limits just to be on the safe side" the police might still bug
him. Even if the farmer told them "I just want to tell people to
not speed and have accidents".

>ends well.

I'm glad this story had a happy ending!

But Sandy, that paper had to be graded the same whether a 20 year old or an 80 year old wrote it, so I see no basis for even thinking about an age-discrimination lawsuit. You're taking the place of the government's FCC examiner (remember sitting in front of him? Scary, huh?), so you have to be objective until it hurts.

We've got to get out of this type of thinking where if something doesn't go our way we immediately consider `lawsuit'.

Who cares! It used to bug me too until someone identified themselves as "N9CALL Friday", now it's kind of a joke. Why does the actual language matter as long as an idea is communicated accurately? Hopefully the new hams will learn the proper operating techniques from hams that know the proper way to operate.

Let's have fun, this is a hobby, not nuclear warfare.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 24/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 24 MAY AND FORECAST UP TO 27 MAY

IPS Warning 14 was issued on 21 May and is current for
interval May 24-25.

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 078/017

1B. SOLAR FORECAST
25 May 26 May 27 May
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 077/016

1C. SOLAR COMMENT
Visible solar disc almost spotless.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: unsettled

Estimated Indices : A K Observed A Index 23 May
Learmonth 13 3333 3322
Fredericksburg 19 10
Planetary 18 08

Observed Kp for 23 May: 2212 2333

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
25 May 18 Active.
26 May 10 Quiet to unsettled.
27 May 10 Quiet to unsettled.

2C. MAGNETIC COMMENT
Mild coronal hole sourced activity expected today. Further geomagnetic
activity expected after May 29.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
24 May normal fair fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
25 May normal fair-poor poor
26 May normal normal fair
27 May normal normal fair
3C. GLOBAL HF PROPAGATION COMMENT
Degraded HF comms expected at mid and high lats May 24-25.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values with 20%
enhancements, during local night.

Observed T index for 24 May: 51

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
25 May 40 Near predicted monthly values.
26 May 40 Near predicted monthly values.
27 May 40 Near predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
No spread F observed during local night. Degraded comms conditions
are expected during the interval May 24-25 due to expected coronal
hole sourced activity.

If your vehicle has an electric-wire rear window defroster, like my 911s
the answer is poorly to hardly at all...and when adjusted for an SWR of 1.3:1
at 146MHz the match went to 7:1 at 145, and 11:1 at 147. In short, the cap
coupled antennas do not work real well at these frequencies if there is ANY
other metal around...and keep it at least 1" away from the metallic edge..or
it wont work at all...I trashed mine via the mail back to Antenna SPecialists
since HRO refused to refund my money.

Hi Susan! Hmmm...I always thought that "dx" had its origins in the Calculus of Libnitz ... the poor sod who invented "dy/dx" as a means of harrasing future undergrads ... the "dx" being a "distance". Perhaps the non-DX'ers adopted it as a sarcastic comment on the "ghost of departed quantities" of distance that these early "big guns" worked?

: I would appreciate it !

Well, it'll do what you want....but might be a roundabout way.

The N0ARY packet/internet gateway could be used to do what you
want. I live in Portland, Oregon and don't bother with getting
on packet at all, except as a remote used of the N0ARY bbs down
in California. That BBS runs on several SUN machines and has
a callbook lookup which you could access via interent (email).

You would need to register yourself with the N0ARY machine as
a legitimate license-holding ham, first.

Then, once that is done, you could get your callbook info by
sending email to: cmd@bbs.arasmith.com
In the text of the message, you would enter: Look WA6BXH WW6J etc.
A short while later, you'd get the info.

I'll attach more info at the end of this message.

Warmest 73 de Sandy, WA6BXH/7J1ABV slay@netcom.com WA6BXH@N0ARY

==========

If you are interested in using the N0ARY packet/internet gateway; or if
you simply want to access his bbs remotely via internet, here are the proper
addresses:

gateway_info@arasmith.com
will automatically send you gateway instructions. These are about
10Kb and tell you how to operate the gateway from both directions.

gateway_request@arasmith.com
This is the address to send in a registration request. You must
include fullname, call, city/state, zip and a phone number. It
normally takes me a few hours to get you registered, it is a manual
verification process. You will be notified when the registration
is complete.

bob@arasmith.com
This is Bob's (N0ARY) address, use it when you have problems.

There is a mirror image of my setup located in Fremont CA, just across the
bay from Sunnyvale, CA. The sysop there is Pat. His addresses are:

gateway_info@lbc.com
gateway_request@lbc.com
pat@lbc.com

N0ARY also has bbss coming up in other areas of the US. I don't know whether or not they will allow unlimited access of their gateways.

In addition, there has been recent requests for a bbs that runs on a Sun. The N0ARY bbs does run on Suns. It was developed on a 3/80 but now resides on his network of sparcs. Since the bbs makes heavy use of network sockets it doesn't have to reside on a single machine although most people run it that way. The code has also been ported to HP workstations and 386/486s running linux. The HP and linux ports where done by Bob Proulx, KF0UW, in Colorado. For info on these ports try contacting him directly at
rwp@hprwp.fc.hp.com

N0ARY just went through a major upgrade in his code and will not have it available for ftp until it has been throughly tested. This activity is in progress. He will try to make an announcement when it is available. To get more information about the bbs and how it functions in a unix environment ftp the file arasmith.com:/pub/n0ary.bbs/Architecture.ps.Z. When the bbs becomes available it will be ftp'able from that same location.

Any other questions, just yell.

Bob Arasmith
bob@hal.com (work)
bob@arasmith.com (home)

: : access to the IEEE publications of that era right now and it seems like it
: : settled out around that time [Siemens for "mho" also has occured as well..])

...yeah, even the "professional" engineers screamed when the change was promulgated. The "threat" used to drive the change was that the (what was the phrase? lemme look up my Wayne Green phrasebook here...oh yeah...) pointy headed IEEE buearucrats would lable anyone who didn't change as an "unprofessional". HAR!

I remember reading in an IEEE pub (I think it was "Spectrum") that many professionals would refer to a frequency as being so many "cycles" or so many "Kilocycles", when they REALLY MENT 'cycles per second'. The change was claimed to be made to correct this missstatement. Professionals who were indeed truely professional would talk about so many hertz or kilohertz or whatever - which would MEAN cycles per second - and thus be politically errr... dat's scientifically correct.

What followed in the largely non-computerized world was a torrent of various versions of the "cycles to hertz nomogram", with special overlays for KC/s to MHz etc.

A good friend (and good engineer) WA6NIL summed it up very well at the time. In these daze of increasing PC, let his words be a reminder to us all...

> oo7@astro.as.utexas.edu

Strangely enough, a Canadian radio station local to Detroit (CKWW I believe)
used to announce the location of 'Radar Activity' to their listeners. In
the beginning they got alot of flaque (sp??) about announcing such things,
but they did continue to inform their listeners, the Windsor Police would
call in the locations daily with the intent of the radio station's announ-
cements.

Please note, that the information I am giving here is by no means current,
and I haven't listened to the station in many years (I no lnoger frequent
the area). DO NOT EXPECT THIS STATION TO STILL PRACTICE THESE REPORTS.
They may, but I don't know.

Vince.

2719. RB327 Agency Mission Statement

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-25 01:59:55 UTC
From: support@garlic.com
Message-ID: <2ruber$jnr@garlic.com>
Source record: 266300

Bid: $RACESBUL.327
Subject: RB327 Agency Mission Statement

TO: ALL EMERGENCY MANAGEMENT AGENCIES VIA AMATEUR RADIO
INFO: ALL COMMUNICATIONS VOLUNTEERS IN GOVERNMENT SERVICE
INFO: ALL AMATEURS U.S (@USA: INFORMATION); CAP, MARS
FROM: CA GOVERNORS OFFICE OF EMERGENCY SERVICES
(W6SIG@WA6NWE.CA) Ph: 916-262-1600
2800 Meadowview Rd., Sacramento, CA 95832
Landline BBS Open to All: 916-262-1657
RB 327 RELEASE DATE: May 23, 1994

Subject: MGT - Agency mission statement

A MISSION STATEMENT for an emergency management agency
communications reserve (such as the Auxiliary Communications
Service, RACES or equivalent) has several advantages.
(1) It provides the initial aspect of key leadership that
is so vital to the success of the communications reserve program.
(2) It protects the agency, and the people whom the
agency serves, against loss of a valuable resource.
(3) It precludes future misunderstandings between an
administrator and program participants. A well written mission
statement can minimize the chance for a serious disagreement that
could have been otherwise avoided.

Although avoiding a statement in writing and playing
things by ear can work --- up to a point --- it has its problems.
The major problem occurs when the official leaves the position
without having documented the mission statement of the volunteer
communications reserve. A change in emergency management
coordinators may be rather frequent in some jurisdictions. A new
staff official can then be at a complete loss to understand the
program. When that happens, the new official may find it easier
to scrap an otherwise good program and its valuable volunteers
for lack of comprehension of its role and mission.

In summary, an astute manager of a communications reserve
unpaid staff (volunteer) program will:
1. immediately protect the future and those who follow
with a mission statement
2. look far beyond ones own expected term in office; and
3. realize that if it's worth doing right, it's worth
writing down.

For ideas or help in the preparation of a mission
statement for your agency, assistance is available by those with
experience in such preparation in a variety of governments. Call
for Stan Harter or Cary Mangum at 916-262-1600.
eom.

Greater than 2 MeV Electron Fluence for 24 MAY is: 6.8E+06

SYNOPSIS OF ACTIVITY

Solar activity continued at a very low level. Several
B-class flares were detected. The visible disk is now almost
spotless.

Solar activity forecast: solar activity should continue
very low for the next three days.

The geomagnetic field was at unsettled to minor storm
levels for the first half of the period. Quiet to unsettled
conditions were observed during the latter half. This
disturbance is attributed to a coronal hole in the northwest
quadrant. This was the first rotation this hole produced a
terrestrial disturbance. Energetic electron fluxes dropped to a
normal background near 24/0500Z.

Geophysical activity forecast: the geomagnetic field
should be unsettled to active on 25 May with some minor
storm conditions expected during local nighttimes. The
disturbance should then subside since the source coronal
hole is about 2 days (28 degrees) wide. Mostly unsettled
geomagnetic conditions are forecast for 26-27 May.

Event probabilities 25 may-27 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 25 may-27 may

A. Middle Latitudes
Active 40/30/20
Minor Storm 15/10/10
Major-Severe Storm 05/01/01

B. High Latitudes
Active 40/30/20
Minor Storm 20/10/10
Major-Severe Storm 05/01/01

HF propagation conditions were normal over all regions
except for a few minor periods of signal degradation for
transauroral circuits during the periods of enhanced
geomagnetic activity. Conditions have since stabilized back to
normal levels. No significant changes are expected over the
next 3 days.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

This same thing happens on the Timewave and the JPS units. Voices that
are "too smooth" will get partially nulled. In fact, the same thing
happens on my 440 noise blanker with a few voices.

>I wonder if the operating instructions might be in error. For example,

The GREEN (not red) light is supposed to blink. If you make the red
light blink, I suspect you are running 50 watts of audio into it :)
Yes, I tested it with lower than recommended audio input, and with
higher than recommended. Results = same = no joy = no nr!

>say NP10-6 (or is it 6-10) 10 Amp-hour, how can I test that?

Most Lead-Acid (I am assuming this from the 6V) batteries are
rated at the 20 hr rate. That is, you take the Ah figure and
divide it by 20 to get the discharge current. In your
case, it is 500 mA. Apply an appropriate load (12 ohms)
and see how long the fully charged battery lasts until
it reaches the cutoff voltage (1.7V/cell or so).
Be sure to use a high power resistor and ask yourself why
you want to do this? It does deep cycle the battery and
will thus shorten its life by about 0.5 to 1 percent each time
you do this.
>
>And how do you test for a charged battery? I set my Multimeter
>to 10Amp, and touch the probes to the + and - of the battery. (I hope
>I haven't been doing -The Wrong Thing-!)

Ouch! Never put an ammeter directly across the battery. That
is shorting the battery out. If the battery has a low enough
impedance, you may very well end up hurting yourself. There
is no easy way to tell the state of charge of a sealed lead
acid battery. If you can get at the electrolyte (i.e. old style
car battery), then measure the specific gravity. Otherwise,
the voltage will give some indication, but since the curves
are different for different makes, and vary with temperature,
it is difficult to make a net-generalization. NiCd batteries
make it even harder to determine state of charge with voltage.
Also, you should let a battery sit for a couple of hours with
no load and no charging (i.e. open ckt) before measuring voltage
to get the best accuracy.

If you want, you can test the battery under load. Determine the
maximum current you want to draw from the battery and obtain
the appropriate power resistor. (say 2A at 6V, then get a 3
ohm resistor). While connecting this resistor across the battery,
measure the voltage. It should stay reasonably close to 6V.
If it sags, then the internal impedance is too high or it is
close to being discharged. This way, you measure the voltage

the battery puts out while supplying a realistic load.

>Well there's one man's view, and if you take Gary's comments at face
>value, you'd believe that HF is a wasteland of "59... also 59, QRZ?".

I didn't exactly say that. Much of the operation on HF is like that,
but there are people willing to engage in conversation on HF as well.
What I was trying to say is that if you restrict your operations to
contesting and Dxing, you'll be the poorer for it. Conditions on HF
aren't generally as pleasant as on VHF/UHF. There's lots of interference
and noise, and propagation is a sometime thing. The tradeoff to that is
greater range. What I really wanted to convey is that you should try to
have *something to say* when you operate rather than just collecting
postal cards.

When operating VHF/UHF, you generally concentrate on the *content* of
the conversation rather than on signal reports and raw distance. On
HF the reverse is often emphasized. You can, of course, operate either
way on either section of the spectrum. I think you'll wind up getting
more out of amateur radio if you concentrate on content regardless of
where in the spectrum you operate.

>#1) how does a thru the glass 2 meter antenna actually work?

Poorly. :-)

Generally, the theory goes that a halfwave radiator doesn't need a groundplane, and can be end fed as a very high impedance. This coupling is capacitive using the windscreen glass as the dielectric.

>#2) what are its disadvantages?

The primary disadvantage of thru-the-glass antennas is that the coax isn't properly decoupled for stray RF. Because of the very high electric field at the feed point, and because the coax shield isn't effectively grounded, there's often a very large RF current induced on the outside of the coax shield. This leads to the typical problems of RF in the cabin. It's often so bad that the coax does the majority of the radiating. I had an Avanti that actually performed just as well with the external whip removed as with it in place. Of course RF got into the instruments, the entertainment radio, and the vehicle's control electronics. It also put a field strength inside the cabin above ANSI safety limits.

Then there's the other problem of having the radiator mounted below the greenhouse. The pattern is asymmetric. Never mind the radiating coax for a minute, the whip itself fires RF through the cabin. If mounted on the windshield, the RF is aimed at the driver's face and eyes. A thru-hole antenna mounted on the center of the roof avoids all these problems. The coax shield is properly grounded and decoupled, and the pattern is in the clear and symmetric. Very little RF is in the cabin. All those advantages for one little hole.

Don't know about CKWW when I lived in detroit I listened to Dick Purtan on CKLW. Here in Sacramento KFBK announces the location of CHP helicopter patrols. I always assumed the info came from CHP but I'm not sure why. I probably works for the CHP, the commuters who listen to traffic reports slow down and the really dangerous folks don't listen to traffic reports.

Ha! Classic RF in the shack problem. You were on the right track suspecting grounding was your problem. Your primary station RF ground needs to be attached to the tuner, and all the other equipment grounded to that point to form a *single point* ground system. If your feed system is really balanced, an effective Earth ground isn't critical, but you have to watch out for ground loops in your installation. The third wire power safety ground can be a problem. It may be a better RF ground on 15 meters than your station ground. So you want to tie it to the single point ground *before* going on to the power outlet. One way to do that is to mount a receptacle box *on the tuner*, and plug your transceiver in there. That will break any ground loop in the power system. (An alternative is to *isolate* the safety ground for RF with a heavy RF choke.) Also, you should be certain that all external cabling to the transceiver is shielded and bypassed properly. All ground leads should be as short, direct, and as low inductance as possible to the single point ground connection.

If your feed system isn't as balanced as you think, you will have RF floating on the chassis of all the equipment. If you do an effective job of single point grounding and bypassing, this won't matter because you will have broken all ground loops through which the currents can flow. Otherwise, a tunable ground *counterpoise* may help. This can range from something simple like a halfwave of wire at 15 meters attached to the tuner's ground point and spread out in a straight line. Or it could be as complex as a MFJ artificial "ground" tuner.

Take a look at your antenna installation. Does one end of the antenna approach a conducting structure? Or does the open wire line come near metal? If either of these cases is true, your antenna and feed may not be as balanced as you think. Fix those problems by changing routing of the feedline or orientation of the antenna. A truly balanced system will have *zero* net RF on the chassis of station equipment, so an Earth connection isn't required. Any imbalance will result in RF on the station equipment, and effective RF ground loop suppression will

be required, and an Earth connection may be helpful.

Note: an *unbalanced* antenna system, such as a vertical quarterwave,
or random long wire, *must* have a good Earth ground [or it's equivalent,
see automobile] for counterpoise, but a balanced antenna doesn't need one.
If you do install a station RF ground run (a good idea for lightning protection
if for no other reason), it should be straight, short, and as low inductance
as possible. Braid or wide copper strapping such as copper roof flashing
makes the best ground conductor because of RF skin effect. Flat strap also
has the advantage of lower inductance than round wire. A single 8 foot ground
rod is usually insufficient termination for a good RF Earth connection.
Several rods connected in star configuration, or a set of buried radials,
make a more effective RF ground termination.

>range, which band will work better? I will be doing most of
>my listening in the evening, if that makes a difference. (Also,
>I could easily string out about 100 feet of wire for an antenna..)

Since no one else appears to have posted a reply, I will offer my thoughts
in the hope that it might help you somewhat.

My advice for this short haul, especially at night, would be 80m, hands down.
You would most likely still copy W1AW quite well at this range on 40m but
skip tends to lengthen out on that band at night, while 80m will usually
provide good coverage from local stations on out to several hundred or
even several thousand miles (depending on propagation).

73 and Good Luck,
Rob

Speaking of test sessions... March 6th I passed my Novice Exam,
and I've been eagerly awaiting my license in the mail since. It's going
on 12 weeks now. When should I start to be concerned? What's the typical
turn-around time in Gettysburg running these days?

Now it also turns out I'll be moving to Oklahoma in another month!
Legally I won't be required to trade in my snazzy H6 Hawaii call sign
(assuming it ever arrives) for a 5 Oklahoma one... but is the current standard
practice to do so? (My understanding is that if I keep the Hawaii callsign,
to avoid confusion I should sign myself "WH6(something)(something) / 5".)

I'd sort of like to keep the Hawaii sign, if it doesn't cause too
much trouble...

<numerous other contributors stuff removed>
>>
>>: Well, how about "obstruction of justice," a full-fledged crime?

Obstruction of justice is generally an after the fact crime
i.e. covering up evidence, interruption of paper work flow
through court system, etc. even though dependant how the
law is worded it can be applied during the commission of
a crime.

Back in the early days of CB radio local cops in and around
Ohio tried applying the "Aiding and Abetting" angle. However
this did not fly too well. Actually I could see why the courts
would avoid affirming it because the next logical step in
the mind of the "gung ho" traffic cop would be to apply
"Organized Crime" laws, here in Ohio this is defined as
5 or more people engaged in a criminal activity on a
continuous basis.....Just listen to CB Ch 19 for about
15 minutes capture all those bad guys and you have a
racketeering conviction under way.

> is still a defense in this country.
>

We do have a bill of rights but most of the Commonwealth states
seems to forget tha fact...Virginia immediately comes to mind
with it's silly Radar detector law.

My observation from the past couple of years of driving the
highways is: As the economy gets worse the state and local
tax base suffers therefore, the cops are directed to write
more tickets. This is supported by talking with friends
who are still involved in law enforcement and who have
stated they are being leaned on to produce more tickets
by the adminstrators of the jurisdictions.

From: drumhell@claudette.nrl.navy.mil
Message-ID: <CqCzzr.AM8@ra.nrl.navy.mil>
Source record: 266477
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna

Just adding another `branch' to this thread...

A few months ago I posted a few questions about through-the-glass antennas. I had recently purchased a 1993 Saturn SL, and was wondering what other Saturn owners had done to install through-the-glass on their vehicles. So after approximately 6 months of casually rooting around for answers I've assembled the following observations/conclusions. The sources are many and varied, e.g. the dealership, other Saturn owners, etc. Some may be fact, others may be folklore... you be the judge.

Question: What are those little black dot around the edge of the rear window?
Answer: They are small conductive (metallic?) dots that aid the rear window defogger. Apparently they act as heat sinks, and allow the defogger to clear the window around the edge. For some reason the manufacturer will not (or cannot) place the conductive metallic strips (for ohmic heating) near the top and bottom edges of the glass.

Question: OK, can I put the through-the-glass antenna lower on the widow, say, between the large black dots, and the first metallic strip?
Answer: Based on other posting, the answer seems to be `no.'
Apparently mounting the antenna too close to the strips fouls up the capacitive coupling. How and why?... I don't know. You would think that they would act as a ground plane, but apparently this is not the case.

Question: OK, so where *can* I mount the antenna?
Answer: You can mount it at the top center of the rear window. At that location will notice a little square gap in the dots with the manufactures trademark in it. This is where the dealership told me to place it. Every cellular phone antenna I've seen on a Saturn has been mounted here. Another possible location could be at the top center of the the front window, just above the rear view mirror, but I haven't verified this yet.

By the way, has anyone ever *removed* a through-the-glass antenna? How difficult is it? Is the adhesive difficult to remove? Does it leave a stain or mark on the glass? Is it difficult to avoid damage the antenna?

Tom,
I hesitate to post this and start this thread all over again, but what the heck, it is summer and things need to heat up a little.

73 is a morse prosign. It means "best regards." To say 73's would be to say "best regards's" which would seem redundant.

My main contention is, don't use morse prosigns on voice; on voice, use words. Don't say things like, "qth and 73" except on cw. If, for some reason, you think you have to, use the correct prosign. Some folks like to murder the prosign on voice and say things like "seventy trees" and "quissy" for "qsy" but mostly that is just a feeble effort to be "cute" or "cool."

I am certainly not a newby, but after only 16 or 17 years of licensed operation, I don't think I'm an OF either. Back when Rover was a pup and Part 97 was on stone tablets and CB was the rage, there was a whole lingo that went along with being a CB'er. Lots of their jargon was borrowed from the hams and evolved to suit the CB'ers. Now, after all this time, some of the CB talk has crept back to us. It isn't so much the words as the attitude that goes along with it.

Part of that attitude conveys the idea that, hey, I'm a ham and I'm something special. I do things that normal mortals can't/don't do. I worked hard (most of us) to get where I am and I'm proud of it and my language, rhetoric, if you will, reflects the elitism that I feel. I use jargon, codes, stylized speech patterns to reflect how I feel.

On the other hand, though, many of us rarely examine what we say or why we say it. We hear, especially as newbies, the things that people we admire are saying and we emulate them. If the Big Gun DX'er across town says "73's" to his DX contact halfway around the world, then even though we can't work the world, we can at least sound like the guys who do.

Many others of us just pick up poor operating habits and pass them on to others. For example, many repeaters have sophisticated computerized controllers that send a courtesy beep when the carrier of a tranmitting station drops. It is obvious to everyone when someone is done talking and they release the mic. Yet, many hams have picked up this habit if saying "over" at the end of the transmission. Maybe they work a lot of ssb on hf,

where it isn't so easy to tell when someone is done talking, or more likely they heard someone else say it, who might have thought it was cool when Broadrick Crawford said it in "Hiway Patrol." The point is, you don't need to say "over" when the repeater, in effect, says "over" for you every time.

These peeves are not burning a hole in my heart, nor am I close to death from stress about them. To me, ham radio is an important part of my life. There is room of all of us, even though it gets a bit crowded once in a while. I just think it is important for someone to speak up now and then, and say "Hey, as good as it is, it can be better."

I throw in a "hell' or "damn" or worse now and then, just ask anyone around here. No one is perfect. The FCC sure as hell doesn't give a damn about it. They won't even kick a few blatent bootleggers off 2 meters in this area. So, it is up to us to have fun, improve our communication skills and carry on the traditions of ham radio...

I have my asbestos gloves and fire retardant sunglasses, so flames will not harm me at all. They will simply be filed to the bit bucket unanswered.

2745. Amp-Hours for a Battery

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-25 13:39:05 UTC
From: n2ayj@aol.com
Message-ID: <2rvkdp$l6o@search01.news.aol.com>
Source record: 266268

In article <CqB9s0.uH@cbfsb.cb.att.com>, mam@cbnewsg.cb.att.com (mark.a.mccuistion) writes:

>How can I determine the 'Amp-Hour' of a battery?

The amp-hour rating of a battery is the product of the current drawn and the time it will provide that current. In this case, you can draw 1 A for 10 hours, 2 A for 5 hours, or (theoretically) 10 A for 1 hour,
or any combination in between. Generally, the batteries are what they say they are if they're in good shape. Some will get hot and be damaged at the high end (much current for short time).

>And how do you test for a charged battery? I set my Multimeter
>to 10Amp, and touch the probes to the + and - of the battery. (I hope
>I haven't been doing -The Wrong Thing-!)

NO, NO, NO! A current meter has a very low resistance. If you do it that way, you're virtually shorting out the battery. Remember this simple rule for how to hook up a meter- "VOLTAGE exists ACROSS gaps (meter goes in parallel), CURRENT flows THROUGH circuits (meter in series).

>I got some neat 6v no-maintenance batteries at the local Hamfest.
>They charge fine, and have the appropriate 6 volts. But If they
>say NP10-6 (or is it 6-10) 10 Amp-hour, how can I test that?

Set up a simple series resistor circuit
to draw a moderate current. Make periodic measurements and graph the result. This is dirt cheap (meter and resistor), and gives a good idea
of the rating for most ham purposes. (And don't get crazy about "deep cycling" the battery while doing this. That is exactly what most exercisers
do; once it a while won't hurt it.)

SM election results

Ballots have been counted in Section Manager elections for the North Carolina and Pacific Sections. Their terms of office began April 1, 1994.

The results are as follows:

In the North Carolina Section
Eugene Ribas, Jr N4UMI, 179
Carl Smith, N4AA, 675
Reed Whitten, AB4W, 726
Whitten was declared elected.

In the Pacific Section
Chester Koga, NH6YW, 113
Bob Schneider, AH6J, 141
Schneider was declared elected.

Six other Sections were not contested. The following were declared elected.

In the Eastern New York Section
Paul Vydareny, WB2VUK

In the Eastern Pennsylvania Section
Robert Stanhope, KB3YS

In the Louisiana Section
Lionel Oubre, K5DPG

In the San Diego Section
Patrick Bunsokd, WA6MHZ

In the South Dakota Section
Roland Cory, W0YMB

In the Virginia Section

Out here in Texas it seems that the common practice is to mount cellular antennas on the fixed-movement side windows for those vehicles with rear doors (as opposed to mounting it on the front windshield, which seemed more common in the DC area). The pros seem obvious (avoid movement of the antenna cable). Can someone comment on the cons? How well does this work with amateur through the glass antennas?

Good advice. In fact, at the range stated (40 to 50 miles) it should
work OK in the daytime as well. 40 might actually work since it's close
enough to give groundwave coverage even at night, but 80 would be best.

Fine idea, but...

I'd be interested in knowing what you look for and what this test tells
you about the level of the charge. I always thought that secondary a
cell's condition was more evident in it's voltage and not its short
circuit current.

I need enlightening

Message-ID: <9405251243.AA24093@hpsctma.neth.hp.com>
Source record: 266284

Hello all,

Since a few weeks I am the owner of a Kenwood TM 742 E dual-bander.

The rig works fine, and I have modified the set after testing it for a few days.

The modification is 1. Expanding the receiver freq. range
2. Activating the cross-band repeater function.

Both modifications can be achieved by changing the position of two SMD
resistors on the main board.

I noticed the next phenomenon after the mod.:

1. The cross-band repeater function works fine without any unexpected problems.

2. The extension of the VHF (2 m) range works fine. Now I can receive AM
air traffic between 118 and 136 MHz!

3. The UHF receiver extension, however, causes a lot of problems. It
appears that the frond-end of the set is oscillating at approx. 210
MHz!! This ONLY happens when receiving OUTSIDE the 70 cm band from
430.000 to 440.000 MHz. The oscillations result in a lot of spurious
mixing products so a proper reception is alomost impossible (by the
way, the set 'transmits' spurious signals at levels of approx. -15 dBm!!!

This problem seems to be typical for the TM742E. I asked some other hams, and
they noticed the same problem.

Is anyone aware of this problem, and is there a possible fix for it??

Pls. let me know,

Regards,

Tom Staal - Hewlett-Packard - Amstelveen - Holland

I am trying to compile and verify a list of ham radio mailing lists or "reflectors" on the Internet. In the process, I have run across a few that don't seem to work. In the following list, I have listed all the mailing lists I know of by name (including host name). Those that "don't work" (typically, because I'm unable to subscribe to them) are asterisked. If anyone is a current user of these lists and can straighten me out, that would be much appreciated. At the end of this exercise, I will post the complete list of lists, with info on how to subscribe and a brief summary of what each mailing list covers.

Well, it does help if you include the list in your message! Sorry, folks. Following is the list. Those with asterisks are the ones I can't make work, and for which I'd appreciate any help. I'll publish the complete verified list once I have checked it out. Please let me know, as well, about any lists I've omitted. Thanks!

BTW: The names that follow are the list names themselves. In most instances, subscriptions to these mailing lists are handled by sending messages to a robot mailing list server with a different address than the listname itself. So please don't send "subscribe me" messages to the addresses below. I'll publish the list-server info as part of the final list of lists, but in the meantime if you must try to subscribe to one of these ** right now ** try one of the following:

send a mail message to the listname with "-request" appended, and include the word subscribe in the text of the message. Example

To: CQ-contest-request@TGV.COM

Text:

SUBSCRIBE

If that doesn't work, then try sending to either majordomo@<hostname> or listserv@<hostname> and in the body of the message put SUBSCRIBE <listname>. Example:

TO: majordomo@stnn.mlo.dec.com

Text:

SUBSCRIBE CT-user

Here's the list:

Scott -

I run a bbs for TAPR, so you can contact me and I will be glad to pass
along any info that you may need.

You can send a a message to fileserv@tapr.org with help as the message to
get more info as well. Drop me a note here, buster@indirect.com, or on
the TAPR system, kw7h@tapr.org and I will see what I can do to help.

==========

Hz is fine wid me. Cycles isn't!

Cycles per second is also fine, but takes longer to say/send.

10 Mc is not 10 megacycles, but it stands for 10 megacycles/sec.

One is a count, the other is a rate.

2771. Motorola GPS engine purchase information

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-25 18:16:01 UTC
From: bonomo@specxn.enet.dec.com
Message-ID: <1994May25.181601.12083@nntpd2.cxo.dec.com>
Source record: 266306

Greetings, one and all!

This message is ASCII text, formatted as <CR> at =<78 characters, tabs at +8.

Have finally received "everything" which I will obtain from Motorola and Trimble, and the order requests have dwindled to a minimum, I have attached the specifications and pricing below.

In a nutshell, the Motorola unit is better in every way, excepting three factors. The Trimble unit:

1) is about 1/8" smaller in width and height,
2) is about .6 ounce lighter,
3) consumes less power in standby, quoted as ~2uA nominal, versus the Motorola's stated maximum of 60uA.

Other than that, the Motorola VP Oncore engine is superior in all ways, including price. The recommendation, from my perspective, is to choose the Motorola unit, but your choice may vary. The above factors, in which the Trimble unit is superior, may be significant ones for you.

I have had requests from 375 individuals, from nine countries, for over 435 units. All this is, of course, based on a "$150" purchase price, which is not available.

Understanding this, it seems best if there is a "standard" configuration which is ordered, as the pricing given is for quantities of 100 and greater. If 100+ want the options, we'll order those, too. Remember, all prices are for 100+ units per item. In other words, if 25 units are wanted with the LNA option, the pricing for that LNA option will be be somewhat higher than the figure quoted below, and I'm not sure if Motorola can (or will) handle one-sie, two-sies and get it right.

****
The recommended "standard" configuration:

Item Price / each (includes Colorado State sales tax)

VP Oncore engine $268
Active Antenna $ 70
Cable to antenna $ 22

Total "standard" $360

****

Options to be considered:

LNA $ 16
battery $ 11

Shipping within the continental U.S., via 2nd day service, will run $10. This includes a box, packing foam and shipping charges. This figure is good for up to ten units.

Those interested in this group purchase should remit monies to the name and address below. Please send non-cash such as personal checks, money orders or the like, as it allows records to be kept much more easily. If less than 100 orders are placed, the checks/money orders will be destroyed, rather than incurring the cost of returning up to 100 of them. Alternately, if you want your check returned in the event of an insufficient number of units ordered, add a dollar bill to cover the cost of an envelope, stamp and my or my wife's writer's cramp which will inevitably result. If the order threshold is reached and an order is placed with Motorola, the $1 will be returned to you with your order. Please include a very complete address to which the order may be sent. Include your current Internet address and telephone number(s) where you may be reached, as well. I've experienced several Inet addresses which have bounced, by the way, so if you didn't receive a response from me directly, it was attempted.

Send orders to:

Thomas A. Bonomo
8147D Summerset Drive
Colorado Springs, Co. 80920.6123

I can be reached, and have been by several individuals, at:

Telephone: (719)593.9883 Home (evenings, weekends)
(719)592.5105 Office (weekdays)
Internet: tom.bonomo@cxo.mts.dec.com

This message will be posted to the newsgroups, as well.

Thanks for your patience as I've gathered information and responded to each of your requests.

Regards,

Tommy

Specifications and pricing information follows.

Motorola VP ONCORE SPECIFICATION DATA SHEET

Receiver Architecture
----

o 6 channel

o L1 1575.42 MHz
o C/A code (1.023 Mhz chip rate)
o Code plus carrier tracking (carrier aided tracking)

Tracking Capability
---
o 6 satellite vehicles simultaneously

Dynamics
---
o Velocity: 1000 m/s when altitude less than 18 km
o Altitude: 18 km for velocities greater than 514 m/s
o Accelleration: 4 g

Antenna
---
o accepts active and passive antennas

Acquisition Time

(TTFF = Time To First Fix)
o 22 sec. typical TTFF (with current almanac, position, time and ephemeris)
o 48 sec. typical TTFF (with current almanac, position and time)
o 2.5 seconds typical re-acquire

Accuracy
---
o Position: less than 25 meters, SEP (without SA).
DoD may invoke Selective Availability (SA), potentially degrading accuracy to 100 meters (2 dRMS)

DATUMs
---
o 49 std. datums, 2 user defined, default WGS-84

Signal Level
---
o TTL

Output Messages
---
o Latitude, longitude, height, velocity, heading, satellite tracking status (Motorola Binary Protocol)
o NMEA-0183 Version 2.00 (GGA, RMC, GLL, GSA)
o LORAN emulation mode
o Software selectable

Operating voltage
---
o 4.75 - 5.25 VDC, 50 mVp-p ripple

Operating current
----
o 230 mA typical @5V, 275 mA max at 5.25V

Standby voltage
----
o 2.5 - 5.0 VDC

Standby current
----
o 60 ua max

Dimensions
----
o 2.00" x 3.25" x .64" (50.80mm x 82.55mm x 16.26mm)

Weight
------
o 1.9 oz. (53.9g)

Connectors
----
o Digital: 10 pin (2 x 5) header on .100" centers
o RF: right angle OSX (sub-miniature snap-on)

Operating Temperature
----
o -30 - +85 degrees C (without on-board battery)
o -20 - +60 degrees C (with on-board battery)

Storage Temperature
----
o -30 - +85 degrees C (without on-board battery)
o -20 - +60 degrees C (with on-board battery)

Humidity
----
o 95% RH, non-condensing

Vibration
----
o 7.7 g, random (survivability)

MTBF
----
o >61,000 hours (estimated)

Optional features
----
o Lithium battery
o Low Noise Amplifier
o Real Time Clock

Pricing (includes Colorado state sales tax)

VP Oncore engine $268
Active Antenna $ 70
Cable to antenna $ 22
Low Noise Amp $ 16
Lithium Battery $ 11

Development Software
1st option $270
includes:
Raw code phase,
disc data,
smooth sat time,
carrier phase

2nd option $215
includes:
above without
carrier phase

Specifications for Trimble SVeeSix GPS engine

Model: SVeeSix-CM2

General

L1 Frequency, C/A code (SPS), 6 channel, continuous tracking receiver

Update Rate

NMEA - 1Hz

Accuracy

Position: 25m without SA
Velocity: 0.1m/s without SA
Time: 1 us (nom)

DGPS Accuracy

Position: 2m to 5m (2 sigma)
Velocity: 0.1m/s
Time: 1 us (nom)

Acquisition (typ)

Cold Start: 2 to 5 minutes
Warm Start: 50 sec with time upload
Hot start: 30 sec with time upload

Reaquisition

<2 sec

Dynamics

Velocity: 500 m/sec max
Acceleration: 4g
Jerk: 20m/sec^3

Environmental Specs.

Operating temp: -10C to +60C
Storage temp: -55C to +100C
Vibration: 0.008g^2/Hz 5Hz to 20Hz
0.05g^2/Hz 20Hz to 100Hz
-3dB/octave 100Hz to 900Hz

Operating Humidity: 5% to 95% RH non-condensing @+60C
Altitude: -400m to +18000m

Physical Characteristics

Dimensions: 3.25" x 1.83" x 0.58"
Weight: 1.3 oz. (36.4g)
Connectors: RF: SMB, I/O: 8 pin (2x4), 2mm header

Technical Specifications

Prime power: +5Vdc (-3% to +5%)
Power consumption: 280 ma, 1.40 watts
Backup power: +3 to +5 Vdc
Backup consumption: 1 uA @3V and +25C (nom)
Serial port/1PPS: CMOS TTL
Protocol options: TSIP @9600 baud, 8-O-1
NMEA 0183 v2.0 @4800 baud, 8-N-1
TAIP @4800 baud, 8-N-1

NMEA messages: Standard: GGA,VTG
Optional: GGA,GLL,VTG,ZDA,GSA,GSV,RMC

Pricing (includes Colorado state tax)

SVeeSix CM2, DGPS capable $321
Antenna (includes cable) $118

2772. Bizarre QST statement

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-25 18:24:54 UTC
From: greg@netcom.com
Message-ID: <gregCqDF5I.J7y@netcom.com>
Source record: 266310

In June QST, there is an article on buying your first HF rig.

Hooray!

However, the author makes a really bizarre statement:

In talking about hybrid rigs, he instructs the neophyte to stay
away from those which have sweep tubes in the final, and go only
for those with 'real' transmitting tubes (6146, presumably).

Pretty much narrows it down to 'Kenwood.'

It lets out Drake 4-line, which he mentioned as an example, FT-101s,
etc.

One wonders how such a bizarre and subjective criteria got by the
editorial staff. Would we really tell a Novice not to buy a good
used TR4C or FT-101!?!

Yeah, I like 6146s better, but sweep tubes are both effective and
available.

One theory of USENET is that people say and do things that they would never do in real life, for fear of getting the shit kicked out of them.

Such as walking into a crowded room and declaring that 99% of the crowd are idiots.

Making one wonder whether Mr. Jones is part of the problm or part of the solution.

Regarding 35MHz in the United States, its still being used by Public Safety Agencies around the country (for a while longer at least). Remote control aircraft would be authorized within the 30-40MHz band. Try 27MHz or 50MHz CB or Ham. If its low-power transmitter (100mW), shouldn't be to much of a problem, but there would be no protection from harmful interference, and if the transmitter is causing interference the transmission would have to cease immediately.

[This is not a legal opinion, mileage may vary, consult with local guru]

>to be objective until it hurts.

Horse-hockey.

Handwriting is a subjective matter, and when deciding whether to give someone the benefit of the doubt, age and infirmity *do* come into it. You have to look at what it will hurt to give him the benefit of the doubt about the penmanship of a single letter. The worst result is that an octogenarian might get his Extra a little sooner; he's already demonstrated that he's qualified to be an Advanced.

On the other hand, by failing to give him the benefit of the doubt, you might deprive him of this joy forever.

If you *are* to be a representative of the government, then having a little consideration for the good of society in an area where you have discretion goes with the job.

Otherwise, we'd might as well leave it in the hands of the two-bit bureaucrats.

I would like to start logging my QSO's on my computer. Any experiences/
suggestions/opinions as to how to start going about this would be appreciated.

I have a PC clone, and would prefer something running inside windows. I
am thinking maybe an ACCESS application or possibly a simple spreadsheet.
I would think (hope) the spreadsheet would get too huge and unmanageable
with time. Possibly a shareware program exists that someone might
suggest?

Thanks in advance and 73,
Bill

Hello !

I'm (still) planning to build a multimode multibander (VHF/UHF) rig.
In the course of designing the SSB part, I am of course facing the
problem of filtering the unwanted LSB.
I've talked on the air with several hams that seem pretty positive that
it is no more possible to find SSB Xtal filters in France.
Does someone have any clue regarding a possible US source for these ?
What I'd like to find out is a 10.7003 to 10.703 Xtal Filter, with at least
60 dB at 10.6997 MHz. But a 9 MHz look-alike filter (or any IF) would
fit also.

Thanks !

2780. RFI ON PANASONIC VCR

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-25 20:26:33 UTC
From: ddepew@CHM.TEC.SC.US
Message-ID: <1994May25.162633.993@pacs.sunbelt.net>
Source record: 266322

I wanted to let you know a "fix" for RFI on older model VCR's. We were
encountering RFI only when a videotape was playing -- it was not coming
through the tuner, the coax cables, etc. -- so I isolated the pickup and
detection around the video head. Using a tip from ARRL's RFI notes (available via their
info server)
I installed a ferrite choke between the head and the rest of the unit.
Fortunately, there was enough "slack" in the wires so that I could make
one turn around a piece of junkbox ferrite I salvaged from a TV yoke.
Taped it in place and asked my kids to check it out while dad transmitted.
Voila! The problem was gone. This was an older model Panasonic vcr but
it should work on others...if there's room. Now if I can just figure out
a way to fix my cordless phone!

Hope this helps somebody.

2782. Converting an old HT-220 to 2M

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-25 20:33:49 UTC
From: usenet@oracle.us.oracle.com
Message-ID: <1994May25.203349.11883@oracle.us.oracle.com>
Source record: 266321
Cross-posted to: rec.ham-radio,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I have a Motorola Ht-220 Type CC3540 Serial # L06K2D Model H33FFN1100E.
It transmits and Receives on 163.5375 MHz. It has a 15 Volt NiCad. It is
crystal controlled. I would like to convert this to 2 meter. Does anyone
know how I can do this? I should be able to swap out crystals, shouldn't I?
The numbers on the crystals (as best as I can tell) are:

xmit: 18170.8
rcv: 48912.50

What do these numbers mean and how are they related to the transmit
and recieve freqs? There is also a "PL Reed" that I will probably need. What
is this? Motorola wants $90 I DON'T THINK SO!. I'd like to substitute with
something a little less pricey.
Last (and least?) I need a charger for the Ni-CAD. I'd like to build
it myself. Any plans out there?

I live in Columbus Ohio but I travel extensively. I will soon be in
the Detroit Michigan area, anyone up there that can help me? Please respond
via email as my access to news is erratic.

My email address is:
dmarsh@oracle.us.com

So many questions, so few answers.

In article <1994May25.061857.16014@ke4zv.atl.ga.us> gary@ke4zv.atl.ga.us (Gary Coffman) writes:
>I didn't exactly say that. Much of the operation on HF is like that,
>but there are people willing to engage in conversation on HF as well.

Waaaaay back when, I had been calling CQ on 20 for about 45 minutes
and was about to pull the switch when someone with a foreign call came
back to me. Well, I was mainly in it for DX, so I returned the call,
then yelled into the kitchen, "Hey dad, where's Guadeloupe?" He said it
was in the Caribbean, so I was kinda disappointed DX-wise, but decided
I'd have a nice chat with the op there. We chatted for about a half-hour;
I had him record a joke to play on a friend, we talked about our occupations,
just conversation.
The moment I signed off with the guy, 20 meters (the ENTIRE band!)
became unusable as a result of the pileup. Then, and only then, did I
realize that I had worked some _real_ DX; a rare country at the time.

Most notable in today's ham world was the absence of interruptions.
Not one single person made a peep between our transmissions; no "W9LID
is standing by," no jamming to shut me up and get me off the frequency,
not a single sound.

Source record: 266331

I'm waiting for my license to arrive after passing the No-Code Tech. I've
been looking into HT's and from reading this group have decided on the 530.

The price I just got from HRO was $434 WITH a coupon; the price went up $35.
If anyone knows of a better price, I'd appreciate hearing about it.

In the mean time, I'm back to studying code!

TIA,

Les

Greetings! I have two Heathkit HW-101s sitting on my desk at home. One, appears to have been bought and assembled when the rig was first released. It uses 6146s (or 6146as or 6146bs) for the finals. The other which was bought and built in '79 has a sticker on the back which states that only 6146As should be used. Can anyone enlighten me on the specifics of the 6146 family? I've put together quite a collection of spare 6146s and 6146bs and hate to think that it was all for naught.

Also, what is the difference between the Ten Tec Paragon II and the Omni VI? I just noticed the ads in the latest QST and the only difference I saw was $200 in price (though the ads didn't give many real details about the rig)...just curious really...

|> used TR4C or FT-101!?!
|>
|> Yeah, I like 6146s better, but sweep tubes are both effective and
|> available.
|>
|> Greg

Just for the record, I'm pretty sure that the FT101 uses 6146s.

I am POSITIVE my FT901DM does use 6146s...I've replaced em at least
once over the years.

As a side comment, and past owner of a vernerable TR3 which uses
3 sweep tubes in parallel...they are an absolute headache to
neutralize!

With the exception of the 101ZD (which is really a low end 901), all
the 101's use 6JS6C's. I know. I have a 101B.

Auction Note - Legal announcement from the Federal Communications Commission

Date: Tue, 24 May 1994 17:02:38 -0400 (EDT)
From: Bob Keller <rjk@telcomlaw.com>
Subject: Auction Notice and Filing Requirements for 900 MHz PCS

COMMON CARRIER PUBLIC MOBILE SERVICES INFORMATION

AUCTION NOTICE AND FILING REQUIREMENTS FOR
TEN NATIONWIDE LICENSES FOR PERSONAL COMMUNICATIONS SERVICES
IN THE 900 MHZ BAND

Report No. AUC-94-01, Auction No. 1 May 23, 1994

The Federal Communications Commission ("FCC") plans to hold a simultaneous multiple round auction for ten nationwide Personal Communications Service (PCS) licenses in the 900 MHz band ("narrowband PCS"). The auction will begin at 10:00 A.M. on Monday, July 25, 1994. Bidding will begin at 9:00 A.M and end at 6:00 P.M. each day thereafter until bidding has closed on all licenses. The auction will be held in the Blue Room at the Omni Shoreham Hotel at 2500 Calvert Street, N.W. Washington D.C., Telephone number (202) 234-0700. Those wishing to participate in the auction must submit an FCC Form 175 in accordance with the Commission's rules and the instructions in this Public Notice. The FCC Form 175 must be received on or before 5:30 P.M. EDT, Friday, July 1, 1994. Applicants are also required to submit a upfront payment of $350,000 per license (in U.S. dollars) for the maximum number of licenses on which they expect to bid in any single round. The upfront payment must be by wire transfer or cashier's check payable to the Federal Communications Commission or "FCC" and must be received on or before 3:00 P.M. EDT on Monday, July 11, 1994. Limited space will be available at the auction for members of the public to observe the auction.

1. Summary of Licenses to be Auctioned

The following table lists by market number and frequency block number the 10 nationwide narrowband PCS licenses grouped by category of license. All ten licenses will be auctioned simultaneously:

(1) Five 50 kHz channels, each paired with another 50 kHz channel:

Market No. N-1, Frequency Block No. 1:
940.00-940.05 and 901.00-901.05 MHz;
Market No. N-2, Frequency Block No. 2:
940.05-940.10 and 901.05-901.10 MHz;
Market No. N-3, Frequency Block No. 3:

940.10-940.15 and 901.10-901.15 MHz;
Market No. N-4, Frequency Block No. 4:
940.15-940.20 and 901.15-901.20 MHz; and,
Market No. N-5, Frequency Block No. 5:
940.20-940.25 and 901.20-901.25 MHz.**

(2) Three 50 kHz channels, each paired with another 12.5 kHz channel:

Market No. N-6, Frequency Block No. 6:
930.40-930.45 and 901.7500-901.7625 MHz;
Market No. N-7, Frequency Block No. 7:
930.45-930.50 and 901.7625-901.7750 MHz; and,
Market No. N-8, Frequency Block No. 8:
930.50-930.55 and 901.7750-901.7875 MHz;**

(3) Two 50 kHz unpaired channels:

Market No. N-10, Frequency Block No. 10:
940.80-940.85 MHz.
Market No. N-11, Frequency Block No. 11:
940.85-940.90 MHz,**

Please note that Market No. N-9, Frequency Block No. 9: 940.75-940.80 MHz will not be offered at the auction. The market numbers and frequency block numbers outlined above should be used in filling out FCC Form 175, discussed more fully below. Businesses owned by women and/or minorities will be eligible for a 25 percent bidding credit on all licenses designated by an (**) above. See Third Report and Order at paras. 72-80.

2. Procedures, Terms and Conditions

The auction will be conducted by Tradewinds International, Inc. and Cantor Fitzgerald Securities, Inc. Prospective bidders must thoroughly familiarize themselves with the procedures, terms and conditions (collectively, "Terms"), contained in the Second Report and Order in PP Docket No. 93-253, FCC 94-61, released April 20, 1994, and the Third Report and Order in PP Docket No. 93-253, FCC 94-98, released May 10, 1994. Copies of the Second Report and Order are available for a fee from International Transcription Services, Inc. at (202) 857-3800. A copy of the Third Report and Order will be included in the Bidder Information Package ("Bidder Package") described below. The Terms contained in the Commission Reports and Orders and in the Bidder Package are not negotiable. Prospective bidders should review these auction documents thoroughly prior to the auction to make certain that they understand all of the provisions and are willing to be bound by all of the Terms before making any bid.

3. Bidder Package

The Bidder Package (as amended and supplemented from time to time) may be obtained by prospective bidders by contacting Tradewinds International, Inc. at General Aviation Terminal, No. 7 Thomas Avenue,

Washington National Airport, Washington, D.C., 20001, telephone number (202) 637-3221, facsimile number (202) 637-3222. The business hours of Tradewinds International, Inc. are Monday through Friday 9:00 A.M. to 6:00 P.M., EDT.

The Bidder Package will contain the following information:

(1) A list of licenses to be offered simultaneously;

(2) The procedures, terms and conditions of the auction;

(3) A copy of the Third Report and Order in PP Docket No. 93-253, FCC 94-98;

(4) An Application Form to participate in an FCC auction ("FCC Form 175" and "175S" or "Short-Form") including instructions on filling out the form and a sample of a completed Form 175;

(5) An FCC Remittance Advice (FCC Form 159) to be submitted by bidders together with their upfront payment, down payment and final payment (described below);

(6) Wire transfer instructions;

(7) An application for a narrowband PCS license (FCC Form 401 or "Long-Form" application) to be submitted by winning bidders only; and

(8) Other general auction information.

4. Short Form Application (FCC Form 175)

In order to be eligible to bid in the auction bidders must submit an application for one or more narrowband PCS licenses on FCC Form 175 prior to the auction in compliance with applicable FCC Rules and Regulations and with the requirements set forth below. Only the person or persons identified on FCC Form 175 as qualified to make a bid will be permitted to bid at the auction. The FCC Form 175 may be submitted anytime after the release of this Public Notice but must be received no later than 5:30 P.M. EDT, Friday, July 1, 1994. Certain information necessary to complete FCC Form 175, such as market numbers and frequency block numbers for nationwide narrowband PCS licenses as well as the Auction No., may be found at the top of this Public Notice.

Completion of Form 175

Applicants are required to complete all the items on the application. The applicant must also identify all parties to the application, including members of bidding consortia, joint ventures or any other agreements, arrangements or understandings relating to the auction or post- auction market structure. In completing FCC Form 175, bidders should note the following:

1. In item 6 of FCC Form 175, Auction No., applicants should enter "1".

2. Item 7 requires applicants to make up a ten digit FCC Account Number, a personal identification number that the Commission will use to identify and track applications. Applicants have two options to create this FCC Account Number. Option 1- an applicant may use its taxpayer identification number (TIN) with a prefix of "0", i.e., 0123456789. Option 2- an applicant may use its ten digit telephone number (i.e., 5552345678). Each applicant should use this same number when submitting additional information/material regarding its application, including any required fees submitted to the Commission on FCC Remittance Advice, (i.e. use the same number for the Form 175 and the FCC Account Number on FCC Form 159). This number must be used whenever an applicant writes, calls, or otherwise inquires about its application. Applicants will also need this number to register for the auction.

3. Items 9 and 10 will be used to determine whether the applicant is claiming a preference in the bidding process. As discussed more fully in the Third Report and Order, certain preferential measures are available to small businesses and businesses owned by members of minority groups and/or women. Applicants claiming a preference should refer to Section 1.2110 of the Commission's Rules (47 C.F.R. sec. 1.2110) for definitions and eligibility requirements applicable to small businesses and businesses owned by women and minorities. See also Third Report and Order at paras. 66-90.

4. In Item 11, applicants should identify the market number for each narrowband PCS license they want to bid on. The market number for each license is listed above. Applicants should list the market numbers for each license they are interested in bidding on in the first column labeled "Market No." If applicants want to bid on more than five markets, they should list each additional market number on FCC Form 175-S. For the Frequency Block No. in item 11, applicants should indicate the frequency block numbers associated with each license they expect to bid on at the auction.

5. In item 12, applicants should list the name(s) of a person(s) authorized to represent them at the auction. Only one bidding number per applicant will be assigned.

6. Applicants should read the "Certifications" listed on the FCC Form 175 carefully before signing the application. These certifications help to ensure a fair and competitive auction and require, among other things, disclosure to the Commission of certain information on applicant ownership and agreements or arrangements concerning the auction. Submission of a false certification to the Commission may result in penalties, including monetary forfeitures, license revocation(s), being barred from future auctions, and/or criminal prosecution.

The Commission has established a Help Line to assist applicants in filling FCC Form 175. That number is (202) 637-3221. Applicants may call the Help Line for assistance Monday through Friday from 9:00 A.M. to 6:00 P.M. EDT.

Microfiche copies of the FCC Form 175 or 175-S are not required.

Failure to sign the FCC Form 175 will result in dismissal of the application and inability to participate in the auction.

Where to Send the FCC Form 175:

In order to be eligible to bid, an FCC Form 175 application must be received by 5:30 P.M., EDT on Friday, July 1, 1994. Late applications will not be accepted. Applications should be submitted either by hand delivery, certified U.S. mail (return receipt requested) or sent by private courier. Whether mailed, hand delivered or sent by private courier, applications must be addressed to:

Tradewinds International, Inc.
General Aviation Terminal
No. 7 Thomas Avenue
Washington National Airport
Washington, D.C., 20001
Attention: Narrowband PCS Processing

Applications will not be accepted if delivered to any other location.

5. Application Fee:

No application fee or FCC Form 159 need accompany the FCC Form 175 for the auction.

6. Procedures after FCC Form 175 Applications are filed.

After the deadline for filing FCC Form 175 applications has passed, the Commission will process all applications to determine whether they are accepted for filing. The Commission will issue a Public Notice listing all applications which are accepted for filing, rejected, and those which have minor defects that may be corrected. The Public Notice will also announce the deadline for filing corrected applications. As described more fully in the Commission's general auction rules, applicants may only make minor corrections to their FCC Form 175 applications. Applicants will not be permitted to make major modifications such as changes in ownership to their applications. Failure to sign an FCC Form 175 cannot be corrected and will cause the application to be dismissed and the applicant to be ineligible to participate in the auction. See Section 1.2105 of the Commission's Rules. 47 C.F.R. sec. 1.2105.

After the deadline for resubmitting corrected applications the Commission will release another Public Notice announcing all applications that have been accepted for filing, including applicants who have corrected defective applications.

7. Upfront Payments

In order to be eligible to bid at the auction, applicants must submit an upfront payment together with an FCC Form 159 to the Mellon Bank. The upfront payment is $350,000 per license for the maximum number of

license on which an applicant expects to bid in any single round of bidding. Payment must be made in U.S. dollars and must be received by 3:00 P.M. EDT, Monday, July 11, 1994, in accordance with the terms and procedures set forth below and the Commission's Rules. The upfront payment may be submitted by wire transfer or cashier's check payable to the "Federal Communications Commission" or "FCC." Wire transfer instructions and the delivery address will be provided in the Bidder Package. Check(s) must be drawn on a bank whose deposits are insured by the Federal Deposit Insurance Corporation (FDIC). An applicant intending to bid on more than one nationwide narrowband license must submit an upfront payment of $350,000 per license for the maximum number of licenses on which it intends to bid in any single round of bidding. The upfront payment submitted by each applicant will define the maximum number of licenses on which the applicant will be permitted to bid in any single round of bidding.

Narrowband PCS licensees will be permitted to aggregate up to three licenses. An applicant may apply for every license on its Form 175, but its actual bidding in any round will be limited to the number of licenses covered by the amount of its upfront payment.

No later than seven (7) business days before the auction the Commission will issue a Public Notice announcing all qualified bidders for the nationwide narrowband PCS auction. Qualified bidders are those whose Form 175 applications have been accepted for filing and who have timely submitted their upfront payment.

8. Registration

All qualified bidders or their designated representatives identified on Form 175 will be required to register for the auction. Registration will be held from 1:00 P.M. to 9:00 P.M. on Sunday, July 24, 1994 and from 8:00 A.M. to 9:30 A.M. on Monday July 25, 1994 at the Omni Shoreham Hotel at 2500 Calvert Street, N.W., Washington, D.C. A confidential bidder number will be assigned to each qualified bidder at registration. Further information regarding registration will be provided in the Bidder Package. All bidders will be required to bring two forms of identification, one form of photo identification (e.g., a valid drivers license or passport) and one additional form of identification.

9. Method of Competitive Bidding

The winning bidders for the nationwide narrowband PCS licenses will be selected through a simultaneous multiple round auction. Bids will be accepted on all licenses in each round of the auction. High bid amounts will be posted at the end of each round of bidding. Bidding will remain open on all licenses until bidding closes on every license. Thus, bidding will stop simultaneously on all licenses.

Bid Submission and Withdrawal Procedures

All bidders or their representatives are required to be present at the auction site in order to place their bids. Each bidder will be required to provide its confidential bidder number and FCC account number in order to place or withdraw a bid. Bids will be placed with bid assistants on site who will input the bids into the auction database. All accepted bids for each license and the minimum bid increment for the next round will be announced at the conclusion of each bidding round. Bidders will have no less than one hour after accepted bids are posted to place their bids for the next round. A high bidder who wants to withdraw its high bid during the course of the auction may do so subject to the bid withdrawal penalty specified in the Third Report and Order at paras. 49-59. A high bidder who wants to withdraw its high bid should notify a bid assistant as soon as possible after its bid is posted as the high bid. If a high bid is withdrawn, the license will be offered in the next round at the second high bid price.

Bid Increments

The bid increment is the amount or percentage by which a bid must be raised above the previous high bid in order to be accepted as a valid bid in the current round. The minimum bid in the first round of bidding will be $.02 per pop per MHz (rounded down to the nearest $25,000). The bid increment in subsequent rounds will be $.01 per pop per MHz (rounded down to the nearest $25,000) or 5% of the previous high bid, whichever is greater. The amount of the minimum bid increment may be reduced in later rounds as the number of active bidders declines. The amount of the minimum bid increment for each license will be announced along with the accepted bids from the preceding round. The following table shows the amounts of the minimum bid increment for each category of license:

Minimum Bid Increment
License Category In the First Round After First Round*

50/50 kHz paired licenses $500,000 $250,000
50/12.5 kHz paired licenses $300,000 $150,000
50 kHz unpaired licenses $250,000 $125,000

*(or 5% of the previous high bid, whichever is greater)

Activity Rule

In order to ensure that the auction closes within a reasonable period of time, we will impose an activity rule to prevent bidders from waiting until the end of the auction before participating. Because of the relatively small number of licenses being offered in this auction we will impose a simplified version of the Milgrom-Wilson activity rule (discussed in the Third Report and Order at paras. 37-40). During the first stage of the auction bidders will be required to be active on at least one license in every round of bidding. A bidder will be considered active on a license if it either is the high bidder from the previous round or submits a bid which exceeds the previous

round's high bid by at least the amount of the minimum bid increment. Bidders will be permitted five automatic waivers from the activity rule during the course of the auction. A bidder must notify a bid assistant of its intent to exercise one or more of its waivers at the time such bidder submits its next bid. Bidders in the first stage of the auction who fall below the required activity level and who have used all five of the automatic waivers will have their eligibility reduced to 0 and will not be eligible to bid in future rounds. See Third Report and Order at paras. 36-40. To speed up the auction the Commission may declare at any time after 15 rounds have passed that the auction will move into a final stage, with an increased activity level. If the Commission declares such an additional stage, bidders would be required to be active on the maximum number of licenses they desire to be awarded. In the final stage, bidders would have their eligibility reduced to the number of licenses on which they are active, unless they invoke an automatic waiver or waivers, in which case they would retain their current eligibility.

Stopping Rules

Bidding will remain open on all licenses until bidding stops on every license. The auction will close if one round passes with no new acceptable bids on any license. Thus, bidding will stop for all nationwide licenses simultaneously. The Commission, however, may declare at any time after 20 rounds that the auction will end after one additional round (or some other specified number of rounds).

Bid Withdrawal, Default or Disqualification Penalty

Any high bidder who withdraws a high bid in any round, defaults by failing to remit the required 20% down payment within the prescribed time or is disqualified after bidding is declared closed will be subject to a penalty described in Section 24.304 of the Commission's Rules. 47 C.F.R. sec. 24.304

Down Payment and Final Payment

The winning bidder for each license must submit sufficient additional funds (a "down payment") to bring the amount of money on deposit with the government to 20% of their winning bid amount within five (5) business days after bidding is declared closed. Winning bidders that are qualified small businesses are required to submit only a 10% down payment within five (5) business days after bidding is closed, with an additional 10% due within five (5) business days after grant of the license. No interest will be paid on any funds on deposit with the Commission.

10. Long-Form Application (FCC Form 401)

As detailed in the narrowband PCS and general auction rules, winning bidders must timely submit a properly completed FCC application for a narrowband PCS license (FCC Form 401) within ten (10) business days after being notified that they are the winning bidder. The Form 401

must be sent to:

Office of the Secretary
Federal Communications Commission
1919 M St., N.W., Room 222
Washington, D.C. 20554
Attention: Auction Application Processing Section

After submission of the FCC Form 401, the Commission will determine whether there are any reasons why the license should not be granted; if there are none, it will grant the license. Winning bidders will be required to pay the remainder of the winning bid amount within five (5) business days after grant of the license. Qualified small businesses will be permitted to pay the remaining 80% of their winning bid amount in installments over the term of the license. See Third Report and Order at paras. 86-90. All license grants will be conditioned on timely payment in full of the bid price.

11. Delay, Suspension or Cancellation of the Auction

The Commission may by Public Notice or announcement during the auction, delay, suspend or cancel the auction in the event of natural disaster, technical obstacle, evidence of an auction security breach, unlawful bidding activity, administrative necessity, or for any other reason that affects the fair and competitive conduct of competitive bidding. In such cases, the Commission may, in its sole discretion, resume the auction starting from the beginning of the current or some previous round or may cancel the auction in its entirety.

> Just for the record, I'm pretty sure that the FT101 uses 6146s.

The FT-101 series used a pair of 6JS6Cs. Until the FT-101Z came out.

I had a FT-101EX, which had a pair of 6JS6Cs running at 100+ watts
output with no cooling fan. Ran like a champ for years. I understand
that the IMD products weren't all that bad either. ARRL lab measured
-34 dB. The Kenwood TS-530 with 6146Bs measured -28 dB.

Apparently, if you use sweep tubes properly they aren't that bad.

On the other hand, I once had a Hallicrafters SR-400 that had a pair
of 6HF5s running at over 200 watts output. Had to replace the finals
every 4-5 months. And I didn't even operate that often!

Just one person's view of life.

73,
Bob K2PH

The mail order place I bought my TH-78A from (I think it was Austin Radio), let me order the radio with just the BT-8 battery case instead of the normal PB-13 battery. I then ordered two compatable batteries from a place called BatteryTech.

The 10 amp/hr rating is over a 20 hour period (500 mA/hr). It won't give you
10 amps in 1 hour. It's a bit misleading but to design engineers long term
discharge is more important.

Andy

2794. Re: 6146A vs 6146

Newsgroup: rec.radio.amateur.misc

Hi, Dave, I looked this up in the handbook, the 6146A is shown with plate voltage of 750V, power out of 70W. The 6146 is shown as 500V, power out of 48W. The 6146B is shown as plate 750V, power out of 85W. This is due to the higher plate current, 160mA instead of 120-135 for the other two. I have an "old" HW101, with 6146's in it, and wads thinking of putting A's in it, and playing with the plate voltage, but, who's got time! Anyway, I think that's the significant differences, if there are any 6146 experts out there, we will be sure to hear from them!.

73s...

In a previous
article, dave@flowserver.stem.com (David Adams) says:

The 3-Hr Ap Indices for 24 MAY 94 are: 18 37 35 20 11 12 14 16
Greater than 2 MeV Electron Fluence for 25 MAY is: 2.3E+07

SYNOPSIS OF ACTIVITY

Solar activity was very low. New Region 7728 (S07E52) was
numbered.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field was unsettled to active for most of
the past 24 hours. Storm conditions occurred from 25/0300-0600Z.
The greater than 2 MeV electron flux was moderate since about
25/0900Z.

Geophysical activity forecast: the geomagnetic field is
expected to range from quiet to active for most of the forecast
period. Effects of a recurrent disturbance may be seen by the
end of the third day.

Event probabilities 26 may-28 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 26 may-28 may

A. Middle Latitudes
Active 30/15/30
Minor Storm 15/05/25
Major-Severe Storm 10/05/15

B. High Latitudes
Active 30/15/30
Minor Storm 15/05/25
Major-Severe Storm 10/05/15

HF propagation conditions continued normal over all
regions except the high latitude paths during the local night
sectors where periodic minor signal degradation occurred.
Near-normal conditions should persist over the next 72 hours.

Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
------ ---- ---- ---- ---- -- ------ ------ --------------------------
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

With the exception of the 101ZD (which is really a low end 901), all
the 101's use 6JS6C's. I know. I have a 101B.

On a completely different note, but speaking of the 101ZD - the 101ZD was
one of a few transceivers used in the movie Cliffhanger. I know the
'what transceivers have been in what movies' thread went wild a while
back, but I just thought I'd mention it.

I think the HTs they used were Kenwood TH-?8s.

Scott

> rcv: 48912.50
>
these are the crystal freqs in KHz. the xmit crystal is 1/9th the xmit freq.

The recieve crystal freq = (recieve freq - 16.8MHz)/3 The 1st if is 16.8MHz. 2nd is 455KHz.

You'll have to tweak the front end recieve LC circuits some, but don't touch the IFs. And tweak all the xmit LCs. How to tell apart? You should get the service manual. Mine refers to H23ff...., so yours may differ some. You might need to add some tiny caps (both physically and in the pF range) to get the LCs down from 163 to 146.

There is also a "PL Reed" that I will probably need. What
>is this? Motorola wants $90 I DON'T THINK SO!. I'd like to substitute with
>something a little less pricey.
If the reed is "4A", it may be compatable with the local repeaters. or the reed circuits could be removed, but there's some small change to make to the squelch.

As for the NiCads, I wouldn't be suprised that they might be dead now. I mean not chargable anymore.

I've been using an HT220 board or my packet radio, crystaled on 145.07MHz. Coupled with a small power amp stage to generate about 8Watts. It's been going for 5 or more years in this service, and the friend who gave it to me had it this way (different freq's for voice work) ten or more years before. It just keeps on going.... We run it off a power supply, and I'm using a J pole antenna.

Subject: ALERT - Internet Virus

From: FRANK H POTTER@G6HQTRS@MCAS CHERRY PT
Subject: INTERNET VIRUS ALERT!
Date: Wednesday, May 25, 1994 7:31:08 EDT

A Virus has been discovered on Internet that is disguised as CD-ROM shareware.

Unknown hackers have illegally put the Chinon name on a destructive
shareware file and released it on the Internet. This catastrophic virus
is named "CD-IT". -- DO NOT DOWNLOAD. IT WILL CORRUPT YOUR HARD DRIVE.
The program, allegedly a shareware PC utility that will convert an
ordinary CD-ROM drive into a CD-Recordable (CD-R) device, which is
technically impossible, instead destroys critical system files o on a
user's hard drive. The program also immediately crashes the CPU, forces
the user to reboot and stays in memory.

Widest dissemination is requested.

2801. RFI Tracked Down!!

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-26 11:05:21 UTC
From: andy@clark.net
Message-ID: <2s1vph$6n7@clarknet.clark.net>
Source record: 266325

I am passing this info along just in case you may be suffering from a similar problem...

Yesterday I uncovered a major source of RFI in my house. This RFI affected reception of both the 2-meter and 220 MHz bands. It drove my scanner crazy. It created minor diagonal lines on channels 4 and 5 of our television sets, both through the cable system and through rabbit-ear antennas. And, I believe it affected the operation of my Boca high speed modem which is especially susceptible to RF, and located one story directly above the source. I suspect it also affected my Mr. Coffee machine, but I can't prove it. ;-)

Last evening I got pretty much fed up with the RFI and made a concerted effort to track it down. The source turned out to be a most unlikely device...our electric hot water heater. Not actually the heater itself, but an energy saving device installed by our local electric utility company (RF, Incorporated) about a year ago. It's a lunchbox-size grey box in series with the ac wire going to the heater. It has several colorful LEDs on the front panel, happily blinking to the tune of "HA-HA-I'M-REALLY-SCREWING-UP-THIS-GUY'S-HAM-RADIO-HOBBY."

The device apparently is *supposed to* emit RF, as it communicates via the electrical wires to the utility's local office, giving the utility company the ability to remotely regulate the AC power going into the hot water heater. With it, our bill is reduced by approximately $100 a year.

While the utility company acknowledged the energy-saver emits RF, they did not know on what frequency. I told them it radiates on just about all the frequencies in the spectrum, and that they should stop by today and get the *&^$#% thing out of the house! It's worth giving up a $100/year electric bill reduction to not be bombarded by so much RF.

: problem of filtering the unwanted LSB.
: I've talked on the air with several hams that seem pretty positive that
: it is no more possible to find SSB Xtal filters in France.
: Does someone have any clue regarding a possible US source for these ?
: What I'd like to find out is a 10.7003 to 10.703 Xtal Filter, with at least
: 60 dB at 10.6997 MHz. But a 9 MHz look-alike filter (or any IF) would
: fit also.

10.7 MHz SSB filters are rather unusual. However, I'm surprised that
amateur dealers don't sell useable filters. In the USA, you can often
buy optional filters to put in your amateur transceiver to get a different
bandwidth than what the radio came with.

However, the trend is to *make* your own filter out of microprocessor
clock crystals. For roughly $10 worth of crystals, you can make a
decent filter and have some crystals for the oscillator(s). They
even sell 9 MHz crystals.

>Greg

Greg,

I think the reasoning behind steering a "novice away from sweep tubes" isn't due to their availability, but the "forgiveness" of the 6146. I agree that a lot of good gear is available with sweep tubes (I'm still using my TR-4C and C-line), and they work well. I think though, that for the beginner especially who may be tuning the rig up for the first few times by him/her self, the 6146 is a bit more forgiving of errors and a "too long key down time". You have to really try and kill a '6146' whereas some sweep tubes especially when they're older and weaker, don't take much to push them over the edge. I also feel that this type of advice is due to the rising price of ham gear (both new and used), since beginners won't be looking towards new gear as much as older, more affordable gear (like the TS-520S, FT-101E, and TR-4C class of rigs), very usable even today, but still either hybrid or all tube designs.

73,

Joe KI3B

Even if you only run a 5-watt rig from your car battery, make sure you've got somebody around with another car and a set of jumpers if you plan to work all 24 hours of field day! Cheaper than a generator, and lots safer than using the car battery is to get a marine deep-discharge battery just for portable operation. You can figure, based on the current drain of your rig on transmit and receive, how much power you'll need for the contest--I use a 25% key-down time estimate for the calculation: (time * receive current * 0.75) + (time * transmit current * 0.25).

Source record: 266339

WRT my earlier post, my rig is an FT-101ZD with two 6146's though I forget if they're A's B's etc. I beleive there's an FT-102 and FT-901 that have 6146 finals, though I was surprised to learn the 101E and other earlier ones didn't.

My first rig was a homebrew one tube "full gallon" 75 watt novice cw rig built from a schematic in the handbook in 1960, the final was, you guessed it, a 6146.

I know of one world-class crystal filter manufacturer based in
France, C.E.P.E. part of Thomson-CSF. I've got one in front of me
now, but no address.

The highest reptation filters in amateur circles are German
KVG Kristall Verarbeitung Neckarbischofsheim GMBH
Postfach 61 D-6924 Neckarbischofsheim
Telefon 07263/648-0

John Birkett
25 The Strait
Lincoln
LN2 1 JF
England

Tel +44 522 520767

Often has surplus crystal filters in stock. I've bought a number of
marine quality 1.4 MHz IF usb, lsb, cw filters from him

The best advice is to first find your filters, then use IF to suit.

Recently a lot of 1.4 MHz IF filters of superb performance have
flooded onto the British market at very low surplus prices (I paid the
equivalent of 40 francs each, although the prices fluctuate) Filters
for AM RTTY and various CW bandwidths are also to be found as well as
proper separate USB and LSB ones. I think of good government surplus
components as a sort of tax refund!

Bon Chance!

From: rogjd@netcom.com
Message-ID: <rogjdCqEuIC.Fzx@netcom.com>
Source record: 266354

I read the article regarding PRB-1, which was featured in this month's CQ magazine, in a state of deep shock. The essential theme of the article clearly seemed to be that PRB-1 has been mangled by the courts such that cities/municipalities can reasonably expect to prevail against amateurs most of the time. This is extremely different than the message which was contained in a QST article on the same subject which was published (I believe) within the past 18 months.

Any knowledgeable lawyers out there (or concerned hams, or both?) care to comment?

My city of Glendale, CA has extremely restrictive antenna regulations: no antenna can be visible, can't be over 25 feet tall, etc. I have always assumed that if they wanted to get it on in the courts that I could defend my right to have my R-5 vertical chimney mounted. (After all, the r-5 is almost 20 feet tall itself; how am I going to keep it from being higher than 25 feet? :-)

Reading the CQ article would cause most readers, I think, to conclude that one's liklihood of prevailing in court is poor.

For all interested, there's also something called the 6146W, which I was
led to believe was a ruggedized, mil-spec version of the 6146B. VERY
expensive if you can find them.

And I have also heard some stuff about HOW to buy tubes. Apparently
6146's are still being made by Penta, a Chinese brand that I've been
warned to stay away from. So I have my spare pair of RCA's, still new in
the boxes, manufactured in September, 1960, and hoping they're still good
for whenever I may need them...

Source record: 266332

Hi,

If I may add my two cents worth, I have seen a copy of the internal tech notes
for the HW-101. It stated that in the 1978 - 1979 time period, some
tubes (6146A) were not manufactured to Heath's quality specifications.
Therefore the sticker was added to the radio kits to warn the users.

A couple of years later the sticker was removed after quality picked up.
I am sorry I don't remember the manufacturer's name of the 6146A.
At that time quality assurance determined that the 6146A could be used
and removed the sticker from the bill of materials for the HW-101.

BTW, I have also heard about the 6146W tubes. My understanding is that
you can get approx. 140 watts out of them, while the 6146, 6146A is
about 100 watts. All this paragraph is hearsay though.

And oh, to paraphrase one fellow on a local repeater, 'Here's my good advice,
and it didn't cost anything, so it must be good for nothing.'.

>Derek Wills (AA5BT, G3NMX)

however, a quantum leap is where a particle changes energy states without any interveneing states..an electron at E0 goes to E1 w/o gradually going throught E0.1, E0.2 etc.

Usually used in advertising to suggest that the new thing isn't an incremental improvement over the old thing but a Brand New Device (but made with 100% recycled atomic subparticles..)

And there's that TV show of the same name where a quantum leap had something to do with time travel or getting drunk in a bar near a coal mine - i don't know which.

As the owner of an FT-101E I would recommend that novices get a Kenwood TS 520 or 820 or 830 instead.

The 6JS6c sweep tubes used for finals in the 101E are difficult to neutralize. The rig was designed for the NEC 6JS6c, which went out of production circa 1980. Other 6JS6Cs do not have as large a plate structure. This causes two problems, plate dissipation is less and the neutralization capacitor is too small. Nothing can be done about the first, other than replacing finals every year instead of every 3 to 4 years, but one can add a mica capacitor across the neutralization variable to fix the second. I found out this after I burned out a choke in the driver stage due to parasitic oscillations from my attempts to neutralize the last set of tubes I installed. This prompted my purchase of a new rig! (long overdue) There appears to be no "standard" for the 6JS6C as the ones I have purchased over the years have quite different internal construction. (yes I saved the old tubes-a fact I can't explain to my wife or to myself. The newer ones I have purchased have plates about half the size of the NECs that came with the rig. I have two GE tubes (purchased at different times) that have very different sized plates! I believe that the 6146 does not

have this variation from tube to tube. I think that the TR-4 and TR-3 use different sweep tubes than the 6JS6C, so I don't know if they have this quality control problem.

As an unrelated issue, the receiver in the FT 101E is more prone to intermod than the Kenwoods as well, and in my opinion the receiver is the most important part of a rig, and should receive more consideration than the types of tubes in the finals. This alone should drive one to the Drake or Kenwood.

I said:
I've usually spent my 6M time on SSB (50.125 and up) but last
weekend played around with FM on the band. It seems that (like 10 FM),
everyone hangs out on the calling frequency (52.525). Are there
other preferred FM simplex frequencies commonly used?
Jim Kurdzo said:
When the band gets really hot, it usually spills over onto 52.490.
Sometimes in the fury on 52.525 I just give my call and say "moving to
52.490". You would be surprised how many guys follow you over there!

Jack, K9CUN said:
I may be wrong but I think there is a band plan for thesix-meter band.

Jack, I think you are right, there is a 6M (FM) band plan in the Repeater
Directory. However, I am not sure it is actually practiced. One problem
is that 6M remote bases are often stuck on one frequency (the calling
frequency). Our local group is thinking about putting up a 6M remote, but
with some frequency agility... hence the questions about which other
6M FM simplex frequencies to program/crystal.

Anyone else have any experience in this area?

>It's often so bad that the coax does the majority of the radiating.

So, how can one properly decouple the coax to minimize the stray RF if we choose to go with the thru-the-glass? I already have a hole in the center of the roof where the 220 1/4 wave is located, and have a cellular thru-the-glass mounted in the top-center of the rear window. Would grounding the coax at the base of the thru-the-glass antenna solve the decoupling problem?

>Then there's the other problem of having the radiator mounted below
>the greenhouse. The pattern is asymmetric. Never mind the radiating
>coax for a minute, the whip itself fires RF through the cabin.

Why would the whip fire RF thru the cabin, on any thru-the-glass antenna (mounted on the rear window) I've seen the entire whip is above the glass and about 95% above the roof itself (depending on the exact shape of the roof).

> which was contained in a QST article on the same subject which was
> published (I believe) within the past 18 months.
>
> Any knowledgeable lawyers out there (or concerned hams, or both?) care to
> comment?
>

Wayne Overbeck's article in June CQ presents a realistic assessment of PRB-1
and the courts. Having been extremely involved in the David Evans, NQ0I,
case cited in his article, I can safely say, that in the 10th Circuit,
PRB-1 isn't worth the paper it was written on.

As to the difference between CQ and QST coverage, you have got to understand
that THE ARRL DOES NOT PRINT BAD NEWS ! They have clearly decided that
it is against their editorial policy. When NQ0I won in Federal District
Court, they gave it lots of publicity. When that decision was overturned
in Federal Appeals Court, nary a word was said in QST !

If you read the tiny print of the ARRL Board of Directors, Executive
Committee minutes in the June QST, you will see an item about Chris
Imlay, N3AKD, ARRL General Counsel, briefing the committee on the
possibility of the FCC modifying PRB-1 to give it more power. What
did Mr. Imlay tell the committee ? Inquiring minds want to know.

|> Stephen P. Baker phone: (508) 856-2625

Ah-HAH!

So my memory isn't quite as bad as I suddenly thought it must me ;-)

We all forgot that their are half a dozen incarnations of the FT101. (Though I will with head in hand admit that I WAS thinking of an FT101A (does this date me just a bit...I remember them when they were NEW ;-)) For that matter, when I bought my FT901, it was only a few years old, and I new the TWO previous owners...thus thought I was getting a good deal on the radio cuz I new what it had already been through.

Anyway, back to the original dicussion...my first SSB was a sweep tube rig as I mentioned, the TR3, and I got 15 years of service out of that dude before I finally sold it a few years ago. (Replaced the sweep tubes twice I think over that period of time...and yes it was a *&%($ to neutralize.) The tubes got replaced due to incessant use and age, not because they weren't hardy enough. I had a grand time with that radio!

In article <2rt9dh$46r@master.cs.rose-hulman.edu>,
derry@NeXTwork.Rose-Hulman.Edu (John Derry) writes:

>> Also, if you say "What is your QTH?", what you are saying is
>> "What is your what is your QTH?"

No, QTH is "My location is".... QTH? is "What is your location?"

So "What is your QTH?" is really "What is your (QTH)?" (parens for
clarity).
and, similarly, "What is your what is your location?" (I assume you
meant that) would be rendered "What is your QTH??"

I"m not sure how to say ?? in phone, as distinct from ?, but there
you have it.

I find QTH to be confusing because it is also used to mean "home",
although people sometimes ask for my "home QTH", as opposed to my
"present QTH"

QSL? is equally confusing, because I take it to mean "You know what I
mean?", but sometimes is really means "Send me a QSL card" (Unusual
for 2 meter repeater use, but I encountered one such on New Years
Eve...)

QSO however, is a useful term in voice... it doesn't mean just
"conversation", but "radio conversation". One does not have a QSO on
the telephone, or in person.

The other use for these abbreviations in phone is to help people
remember them - without such constant use, some may not remember the
right common Q signal on CW. Judicious use of Q-signals in phone
doesn't bother me... but indiscriminate use sure does!

Best wishes! Best wishes! (would that be "73s" or "146"?)

> I have a Motorola Ht-220 Type CC3540 Serial # L06K2D Model H33FFN1100E.
>It transmits and Receives on 163.5375 MHz. It has a 15 Volt NiCad. It is
> xmit: 18170.8

The transmitter in these uses freq. triplers to get up from the xtal freq. to TX freq. 18170.8 x 3 x 3 = 163537.2. Mine is a 462 MHz unit that has one more tripler to get up there.

> rcv: 48912.50

Let's see... receive xtal = (Tx freq - IF freq) / n; where n = 3,9,27 etc. Using n=3 we get an IF of 16.8 MHz, which sounds reasonable. International Crystal Mfg. has crystals for these radios - call them at 405 236 3741 and tell them what you have. You may need model number and "chassis number" which is a number like NUE6001BA that you can find inside the battery compartment. The xtals are a bit pricey - $15 to $25 each, but what the heck, I only paid $10 for the radio at a flea. You will need to re-tune the tuned circuits in the radio, and for this you will need the Motorola manual... try Motorola or a local service shop for that. I copied the 450-488 MHz radio manual that another ham here had around. Make sure whoever knows you are re-tuning to a ham band, or else they'll want to know your commercial license #!

By the way, I have a line on cheaper crystals from a different source, still waiting for someone to get back to me on that.

>There is also a "PL Reed" that I will probably need.

This is pre-microprocessor coded squelch technology. A tiny mechanical reed functions similar to a quartz crystal, except at audio freqs. If you're going to use the HT to get into a repeater with PL tone access you need it, otherwise you don't, like for simplex. Mine came with one, but you could always add one of those tiny PL decode/encode boards from the back of QST.

> Last (and least?) I need a charger for the Ni-CAD.

Yah, these radios typically are placed in a "drop-in charger" which does the job. I'm not sure how I'm going to handle this myself... The battery that came in mine was good, though, and charged up to 15V no problem. Pick up a spare at a flea, as Moto wants something like $75 for them.

> Doug N8TUT

Good luck with the mods! I'll be doing mine as soon as I find out about those cheap xtals! Makes an interesting project...

2841. Re: Amp-Hours for a Battery

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-26 19:12:29 UTC
From: patm@bga.com
Message-ID: <2s2sat$du6@giga.bga.com>
Source record: 266367

There is a relationship between open-circuit voltage, temperature and state of charge. Panasonic publishes a technical pamphlet for their line of sealed gel-cell batteries which contains a graph yielding the percentage of charge remaining for any given open circuit voltage. The cell temp is important, Panasonics reference temp is 77 F. Open circuit voltage means that the battery has been neither charged or discharged for several hours.

But *roughly* an o-c voltage of 12.9 -13.0 means 100% and 11.9 - 12.0 means about 10%. The relationship is not perfectly linear but is close enough that if I read 12.45 V I assume a 50% charge remaining, etc. Caution: I have also found that this only works with a battery that is in good condition. Abuse by severe overcharge or 100% depletion will change the o-c voltages and render this method unreliable.

I frequently buy gel-cells at hamfests and carry a small DMM with me. I never buy a battery that is outside of the 12.0-13.0 range and its got to be a real bargain if it reads below 12.5!

Also, another thing I look for is any bulge or depression on the sidewalls of the battery. I don't know what the cause of this is, but in my experience it has been a sign that complete failure of the battery is imminent.

2842. HF starter rig recommendations (was Re: Bizarre QST Statement)

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-26 19:13:30 UTC
From: vinod@watson.ibm.com
Message-ID: <2s2scq$17a8@watnews1.watson.ibm.com>
Source record: 266262
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

This seemed like an opportune moment for a post I have been wanting
to make for sometime.

I read the QST article with much interest, as I am going
to be looking for a used HF rig in a couple of months or so. I am
waiting for my no-code ticket, and am studying code right now. I
was thinking of getting a tranceiver to listen to W1AW code practice,
but instead got a ten-tec single band kit, which I am goint to build
this weekend, thus postponing the tranceiver purchase until after
I have my novice ticket.

So, please send me your advice on what I should look for in a used
HF rig. I expect to be able to spend around $400-$450 max, for the
rig, tuner, and power supply. So:

- What models would fit the above criteria?
- What features should I look for?
- What should I avoid?
- Can I get something which is all solid-state for the above price
range?

I am cross posting this to rec.radio.amateur.equipment as that
is probably a more appropriate group for followups. Also, please
feel to email directly to me, and I will summarize to the net.

Many thanks in advance.

: As a side comment, and past owner of a vernerable TR3 which uses
: 3 sweep tubes in parallel...they are an absolute headache to
: neutralize!

Hmm. I've got to agree with Greg. I find the warning about sweep tubes a bit overdone. I've also not had any great difficulty in neutralizing my TR4 (3 6JB6s) or T4X (2 6JB6s).

These radios were my first introduction to HF, and I think they've served extremely well as beginner's rigs. The 6JB6 sweep tubes used in Drakes are readily available, fairly inexpensive (even for quality US NOS) and robust enough if you heed the warnings in the manuals. Drakes are quality older radios and its a shame to steer newcomers away from them.

What the author really should have done rather than warn beginners about sweep tube finals is to warn them about the vagaries of radios with older, harder to find electrolytic filter capacitors that delight in failing at the worst possible times. The only sweep tube failure I've had came from a filter cap in the Drake power supply dying, which caused the TR relay to fail, ultimately trashing the PA tubes. All, of course, while I was out of the room for a while. I kinda doubt 6146s would've fared any better.

Bravo! Damned fine point! Agreed wholeheartedly!
I'm newly licensed 3 weeks now, but I've been listening on my scanner
for 6 months. The way _I_ was taught versus how some of the
hams do it is 180 opposite.
I was taught to say "This is KB8SGL monitoring(or listening)" when
I am just pokin' on a channel, waitin' for a QSO. I hear this:
"This is AB1CDE listening on 146.88"

Why the hell do you need to tell me the frequency I'm listening to?

>Use of Q signals on phone doesn't make much sense either. Better to use
>JUST PLAIN ENGLISH, or whatever you speak wherever you live. It takes
>more effort and time to say "QSL" than "roger". Also, if you say "What is
>your QTH?", what you are saying is "What is your what is your QTH?".
>
Agreed again! I was told "Do NOT use Q signals on phone. Use plain
english!!!" Since I don't know CW at all, I know very few Q signals.
When people ask me something, like, "What is your home QTH?" I know
what they mean, but I ask myself "Why the hell don't you just ASK
me where I live?"

>Finally, every amateur should learn the standard phonetics and use them no
>more than necessary.
>
<Massive amounts of cheering and agreeing in background>
I sign : Kilo Bravo Eight Sierra Golf Lima (lee-ma) KB8SGL
I do NOT like to hear
"Kathy Bathroom Eight Salt Grapes Laxative"
I learned standard phoentics so I can understand a transmission which
is so staticy and garbled, when I hear

"...is ... avo..arlie...ix..pa..omeo...elta" I can almost certainly
say BC6PRD . If I hear somethign else, I won't respond.
It's my practice when I'm monitoring to ignore all transmissions
which are not within *my* standards. Why respond to
"Coke Albert Three Very Large Zebra"? Who knows what they're doing?

For all i know, I should report them to the FCC for sending an
encoded/encrypted message across amatuer bands.

>The habits an amateur acquires when not participating in net operation
>will undoubtedly carry over to those times when quickness and efficiency
>are of utmost importance.
>
Yes, but the veterans who have been around for god knows how
many years will argue they do it THEIR way and THEIR way has been
working for years, so why change now?

: Good advice. In fact, at the range stated (40 to 50 miles) it should
: work OK in the daytime as well. 40 might actually work since it's close
: enough to give groundwave coverage even at night, but 80 would be best.

Due to the terrain W1AW groundwave coverage is actually quite poor--which
is probably a relief to most HF operators in CT! Doesn't take too many
rolling hills to wipe out the signal. I ought to know, living just one
mile away and making two thousand contacts from W1AW.... The guys that
picked the place weren't into VHF operating until a few years later...

2847. RFI from light switches

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-26 20:21:41 UTC
From: n4zr@netcom.com
Message-ID: <n4zrCqFF86.5xK@netcom.com>
Source record: 266256

Has anyone out there ever encountered RFI from light switches? I don't mean dimmers or capacitance touch-switches, but ordinary 72-cent silent wall switches.

Last winter I started getting interested in 75-meter phone DXing. In the process I began listening with my receiver in USB mode. To my surprise, there was a very loud and frequently-present rough carrier on about 3760 KHz, accompanied by buzzy impulse noise extending only on the lower side, down about 20 KHz. After some exploration, I discovered another "carrier" at about 3513, with noise extending below IT down past the lower band-edge. Both signals were well over S-9, but nobody else in my town could hear them.

I got a portable radio with BFO and began sniffing around the neighborhood. Sure enough, the noise localized to a neighbor's house. I explained the situation to him, and we started sniffing around the place. We found nothing until, in the course of events, he turned ON the bathroom light. Suddenly, the noise stopped. I had him turn the switch off, and it started up again.

The bathroom light in question is incandescent, with no dimmer or other active device in the circuit. I replaced the light switch for him (with the same brand of garden-variety spdt switch), and no more noise.

A few days later I discovered another pair of "carriers" in roughly the same places on the band, with similar characteristics but not quite as strong. To shorten things, I sniffed and found two more light switches, same kind, which were the source. When I replaced them, the noise vanished.

I haven't noticed any more of these signals since, but you can imagine the potential -- I live in an area with over 200 houses, each with at least 10 of these switches.

So does anyone have similar experience, or a physical explanation for what was happening? I was not drinking on either occasion, BTW ;}.

>of the roof where the 220 1/4 wave is located, and have a cellular thru-the-
>glass mounted in the top-center of the rear window. Would grounding the coax
>at the base of the thru-the-glass antenna solve the decoupling problem?

Yes it would, but you can't because glass doesn't make a good RF ground,
and any length of conductor over to a good RF ground has inductance. They
tell you not to mount the antenna within 2 inches of the edge of the glass
because the presence of metal near the antenna base screws up the capacitive
coupling. That's also why you can't mount them over heater wires or over
metalized glass tinting.

If you can get a good *short* low inductance coupling to RF ground from
the coax shield at the antenna base, you can keep most of the RF off the
coax. A piece of 5 inch wide copper flashing a couple of inches long
should work. Get much longer and you're an appreciable fraction of a
wavelength at 440 MHz. However, if you connect to the edge of the windshield
frame, it becomes a slot radiator antenna, not the ground you were hoping
to find. The window frame actually makes a pretty good slot radiator at
two meters. That's why hooking up the little ground wire/tab they supply
often makes RF in the cabin problems *worse* not better.

You could try slipping several large ferrite beads over the coax to
form a choke balun. That might work OK, but looks unsightly hanging
in the window.

>>Then there's the other problem of having the radiator mounted below
>>the greenhouse. The pattern is asymmetric. Never mind the radiating
>>coax for a minute, the whip itself fires RF through the cabin.
>
>Why would the whip fire RF thru the cabin, on any thru-the-glass antenna
>(mounted on the rear window) I've seen the entire whip is above the glass
>and about 95% above the roof itself (depending on the exact shape of the roof).

The entire whip isn't above the window. At least 5 cm of it has to be
below the window edge to reach the capacitive coupled base. That's a

lot at cellphone frequencies. And mounting close to the window
frame can excite the frame as a slot radiator as mentioned above. Of
course cellphones don't run much power, and don't need much of an antenna
to perform satisfactorily, so through-the-glass antennas are good enough
for that application. However, with ham rigs running 45 watts and operating
on 2 meters or 70 cm, they just aren't very good, or very safe from the
standpoint of RF exposure in the cabin.

In my truck, I use a Comet dualband antenna mounted in a hole in the
center of the roof, and a triplexer, to handle 2 meters, 70 cm, and
cellphone. The antenna really isn't resonant for cellphone, but like
I said, it doesn't take much for cellphone, and the phones don't seem
to care that they're operating into a mismatch. Getting the antenna out
in the clear seems more important.

I see it as a courtesy.

It is a matter of safety for the driving individuals than anything
else because it allows the drivers desiring to listen or respond
to know which frequency you are using and quickly take thier radio out
of scan mode and set it on your frequency --- all without taking their
eyes off the road for very long.

It also helps others at home with their base station set to scan to know
the same thing even if they are listening from across or in another room.

I don't know about it being a pet peeve, but I do find it funny.
Sometimes if it's just to butt in for your 10-minute ID, yes I can see it.
But it's rather redundant otherwise.

Same I guess for half the calls that add "mobile". I mean, for the most
part I think it's great that the caller is driving around or whatever, but
9 times out of 10 it really makes no difference to me whether you're
driving, walking, or standing on your head during your conversation. There's
hardly anything that can interrupt or interfere with a conversation while
mobile that couldn't also happen if you're "immobile" -- including walking
through your house if overpasses are an issue. Even still, if
I tell the person that their signal is bad, I really don't expect them to
pull over to the shoulder anyway. Perhaps I should have some fun with this
habit and say things like "KD6QPY scratching" or "KD6QPY digesting".

>>It might make communications much easier if we just said what we
>>meant all the time, which means proper phonetics and procedures.
>>The cute stuff is OK when you know you are S9+, I suppose.
>
>Hear hear!!! Here here, too.

Yep. Although "QSY" is much simpler than its true translation, for the
most part saying things like "What's your QTH?" seems a lot simpler as
"Where are you?"

Ahh, these are the amusing little quirks of the trade. Just appreciate
them for the amusing oddities that they are.

To all radio amateurs

SB DX ARL ARLD031
ARLD031 DX news

The items in this week's bulletin are courtesy of JARL, the Ohio/Penn DX Bulletin, Yankee Clipper Contest Club PacketCluster network and Contest Corral from QST. Thanks.

PAKISTAN. AP2JZB was heard on 21299 kHz at 1636z. QSL via K2EWB.

IRAN. EP2DL was heard on 14151 kHz at 0045z. EP2ASZ has been heard a couple of times recently on 20 meter CW around 2200z.

NEW FREQUENCIES FOR JAs. On May 20 the Japanese Ministry of Posts and Telecommunications made the segment 3747 to 3754 kHz available to Japanese amateurs. This allotment is in addition to 3500 to 3575 and 3791 to 3805 kHz segments.

FRANZ JOSEF LAND. 4K2BY, 4K2MAL, R1FJL and R1FJC have been active, mostly on 20 meter CW between 2130 and 0300z. R1FJC has been on the 14247 DX Net around 2145z and 4K2MAL has been heard on 18078 kHz at 2020z.

WESTERN SAMOA. Cliff, 5W1GC gets on 7001 kHz from 0830 to 1115z. He can sometimes be heard around 10103 kHz during the same time frame. Also check 18070 kHz at 0145z and 14218 kHz at 0330z.

BURUNDI. On May 21 9U/F5FHI on 21286 kHz at 1745z. No documentation has been received for this operation.

BAHAMAS. Mitch, KH6M, will sign C6AHY on 160 through 10 meters. His main effort will be in the CQ WW WPX CW Contest this weekend. QSL via WA4WTG.

AUSTRAL AND MARQUESAS ISLANDS. Nao, NX1L, and Kan, JA1BK, who is presently signing FO0MIZ on Tahiti Island, are going on a DXpedition to these two new, prospective DXCC countries. They plan to file a petition with the DXAC for new-country consideration after their

trip. Kan will operate from Rurutu Island of the Australes group May 28, 29 and 30. Then on to Nuku Hiva Island of the Marquesas group from June 1 to 11. Nao will accompany Kan for the first 9 days and sign FO0AKI. QSL FO0MIZ and FO0MIZ via JA1HGY, and FO0AKI via NX1L.

SOUTH KOREA. HL9DC was heard on 7005 kHz between 1030 to 1200z. Lee, HL5AWS, can be found between 14180 and 14205 kHz around 0745, 1115 and 1415z. Harry, HL9HH, checks into the the 14226.5 DX Net as early as 2315z. HL3IWD gets on 14018 kHz between 1100 and 1200z.

SAINT VINCENT. Rudi, DK7PE, is now active as J8/AH0G on all bands working mostly CW. QSL via DK7PE.

ALAND AND AHVENANMAA ISLANDS. These two will be activated by a team from Helsinki during the CQ WW WPX CW Contest. This all band effort will use the call sign OH0AAQ. QSL via OH2NRV.

CONGO. Joe, DF1AL, of recent 3A-land fame, is planning a DXpedition for February 27 to April 6, 1995. Hopes are for this to be an all band multi-op effort with satellite station as a bonus. On May 18 TN1AT checked into a DX net on 14247 kHz at 2130z.

MACAO. XX9GD was heard on 50135 kHz at 0154z and 3799 kHz at 1204z. QSL via Antonio A. P. B. Costa, Box 1476, Macao. XX9AW was heard on 14200 kHz at 1345z. QSL via KU9C.

ASCENSION ISLAND. Jim, N6TJ, is active as ZD8Z until June 2. Besides a serious contest effort, Jim plans pre-contest 160 meter work. QSL via VE3HO.

THIS WEEKEND ON THE RADIO. The CQ World Wide WPX CW Contest, sponsored by CQ Magazine, is from 0000z May 28 to 2400z May 29. Operate no more than 36 hours. Exchange RST and serial number starting with 001. For complete details check page 111 and 112 of February QST.

World Telecommunications Day, sponsored by LABRE, is from 0000 to 2400z May 28 for CW, and 0000 to 2400z May 29 for phone. Work stations once per band exchanging signal report and serial number starting with 001. More info is on page 136 of May QST.

2854. Re: 2 meter thru-glass

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-26 21:30:55 UTC
From: drumhell@claudette.nrl.navy.mil
Message-ID: <CqFIFJ.69C@ra.nrl.navy.mil>
Source record: 266266

Look here folks. A lot of technical folklore gets passed around the amateur community, and some of it is incorrect. But of all the subjects that suffer from the propagation of inaccurate technical folklore, the subject of antennas suffers the most.

I have ask for, and have received advice about antenna installations. Some of it good, some of it bad. Many opinion are in conflict:

...you need a ground plane... no, you don't need one... my through-the-glass antenna works great... mine sucked, so I returned it... you must use a balun... why? ... well, just because... RF current occurs on the feedline ... well then why is the coax on top of the ground plane (car roof)?... gee, I don't know, good question...

Now I have to admit that even I have contributed to this problem.

So now I ask the academics out there to respond, not some elec-tech.

Question: Has *anyone* done a comprehensive scientific study of the performance of through-the-glass antennas, or any other mobile antenna installations. This includes input impedance, radiation patterns, etc. I'm looking for an IEEE paper showing how Halen's integral equation is solved, and not some QST article with a couple of mismarked graphs showing a radiation pattern measured using a field strength meter from Radio Shack and a tape measure.

Antenna theory is not my specialty, but it would be refreshing to read something written by someone with scientific authority, and not by someone who `know antennas,' but still uses the `left hand rule' to derive the magnetic field due to electron current flow.

I can only see one reason for telling the frequency that I am on, so that someone listening on a scanner will know which frequency the call was on if they don't catch it in time to see it. I have only used this technique when calling a specific person though. I can't really see the need when monitoring.

Well, there is a good reason auto batteries don't have Ah capacities.
Their sole purpose in life is to give you hundreds of amps for a few
seconds for as many days as possible. If you put them into cycling
service such as for battery op radios, they will have a very short life.
They aren't constructed for cycling and a few deep discharges will do
them much harm... get a deep cycle (marine/rv/golf cart) battery.
They aren't that much more expensive, and they are rated to do what you
want.

If you still feel compelled to use car batteries (they are cheap), a
useful figure is the "reserve capacity", defined as the number of
minutes a fully charged battery will supply 25 amperes at 25 degrees
C to 1.75V per cell. (That 77 deg. F for you metricphobes). This
should give you some indication. Most batteries I've seen are in
the 80 minute range.

Good luck.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 26/2330Z MAY 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 26 MAY AND FORECAST UP TO 29 MAY

IPS Warning 15 was issued on 26 May and is still current for
interval 28 May to 7 June.

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 071/006

1B. SOLAR FORECAST
27 May 28 May 29 May
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 070/005

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet to unsettled, with brief active
period 09-12UT.

Estimated Indices : A K Observed A Index 25 May
Learmonth 11 2334 2222
Fredericksburg 12 24
Planetary 15 20

Observed Kp for 25 May: 3544 2324

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
27 May 15 Quiet to unsettled.
28 May 20 Quiet to unsettled.
29 May 35 Quiet to unsettled initially, then increasing to
active to minor storm levels.

2C. MAGNETIC COMMENT
Recurrent disturbance expected from 29 May onwards.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
26 May normal normal fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
27 May normal normal fair
28 May normal normal normal
29 May normal normal normal-fair
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values, with 15-20%
enhancements 08-13UT.

Observed T index for 26 May: 38

Predicted Monthly T Index for May is 30.

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
27 May 35 Near predicted monthly values.
28 May 30 Near predicted monthly values.
29 May 20 Near predicted monthly values.

4C. AUSTRALIAN REGION COMMENT
Degraded HF comms expected after 29 May.

2859. Re: Bizarre QST statement

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-26 23:23:02 UTC
From: t1terryb@cascade.ens.tek.com
Message-ID: <2s3b0m$t1@cascade.ens.tek.com>
Source record: 266273

I can't agree more about the old TR3/4's and T4X's. Drake built very fine equipment that were excellent first rigs for a new ham, myself included. They were easy to use, forgiving when mis-tuned, and went a long way keep a new guy from flat topping. Sadly, they are very dated now with the WARC bands and the no tune broadbanded solid state rigs. Kind of a pitty not having to learn about diping the plate and loading the load, HI HI (oh sorry, you new guys don't like ham speak).

That's done so that their VOX continues to key the xmtr; otherwise at every pause their xmtr would drop off and you'd miss the first syllable (at least in the older gear) of their next spoken word.

2861. lithium AA cells, 1.5 volts?

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-26 23:37:45 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9405261637.aa06435@paris.ics.uci.edu>
Source record: 266235
Cross-posted to: rec.radio.amateur.misc,rec.radio.swap

Anyone know a good source for reasonably priced 1.5 volt lithium AA sized cells? I am about to take off on the Pacific Crest Trail and will need to reliably power my 40 meter CW rig and 2 meter HT for a few hours each week, and I want to use the best I can find, which would be lithiums.

I wonder about sources and prices if anyone else has researched this.

2862. HAMs in Oswego, NY area

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-27 00:33:18 UTC
From: schneja@ucunix.san.uc.edu
Message-ID: <1994May26.193319.7642@ucbeh>
Source record: 266232

Hi, I will be moving to Oswego, NY to start an assistant professorship at SUNY-Oswego in August. I was wondering if there are any HAMs on the net from that area that can clue me in to all of the ham radio activity there and possibly point me in the right direction as far as finding a place to live. I'd like to rent for the first year or so and look for a house after that. I'll need at least 3 bedrooms and preferably four. Of course alot of space to string an antenna will be nice too :-) Any help would be appreciated. Please respond via email.

My teenage son N2WKS (Advanced tested end of Feb --license arrived
this week) uses the spreadsheet in MicroSoft Works for his logging..
He tried a few logging programs before deciding to use the spreadsheet.

2864. QRZ Beta Testers Needed

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-27 01:39:52 UTC
From: flloyd@pinyon.libre.com
Message-ID: <2s3j18$arq@pinyon.libre.com>
Source record: 266223

The QRZ! Ham Radio CDROM Volume 3, June 1994 Edition is about
ready to go to print and we need volunteers who are willing to
Beta test the new QRZ-II Windows software.

The new QRZ-II software is written in Visual Basic and uses a new,
QRZ Dynamic Link Library (.DLL). The DLL is compatible with VB
and should also be compatible with C, and C++, VC++. If you're
a software developer and would like an advance copy of the DLL,
please indicate so separately.

The QRZ-II software has a number of enhancements over the previous
versions of QRZ Windows including enhanced printing with adjustable
fonts and sizes, recently accessed callsign memory, new .DBF
output file formats, improved name searching and more.

I'd like to get 10 or so volunteers who would be willing to test
the software on their systems and report back to me via e-mail.
As a bonus, the top 6 bug reporters will receive a free copy of
Volume 3 when it becomes available.

If you'd like to be a QRZ Beta tester, here's what you'll need:

o Your own copy of the current, December 1993 QRZ! CDROM
o A PC running Windows 3.1 (hopefully a 386 or better) or -
o a higher level system such as NT, OS/2, Wabi, or Soft Windows
o Access to Internet ftp for the code
o An Internet e-mail address
o A sense of humor

Sorry, but I can't honor requests for those who are only "interested"
in the new software. Instead, I need volunteers who will actively
use the product and report back on their progress. The length of
the Beta program will be approximately 2 weeks (gasp! is that all!?!?)
and will begin immediately.

If you'd like to participate, please send an email to me at:

aa7bq@qrz.com

> >
> --
Since no one else has picked up on this, I'll put in my recollections.
Back in the early 70's, someone from the local Heathkit store spoke at
a club meeting and advised us not to use the 6146B version. I don't
remember if he was clear on the exact reason but my guess is that the
capacitance in the "B" is different and can't be neutralized by the
Heathkit circuit. I never used the "B" and I've had at least three
transmitters with 6146's. (Boy I hope I'm not the oldest OF on the net.)
Two of those transmitters are on the same table as my TS440 and all
have been used within the last year.

Interesting how things go round in cycles. Here we are, 150 years
after Morse, sitting at our "workstations", tapping away.

Now we are all telegraphists (or telegraphers- look it up).

>Any suggestions or comments?

There are control head disassembly instructions in the owners manual.
I've not had to do it, but it looks pretty easy. Incidently, my
schematic shows 3 9 volt light bulbs, not LEDs. This would be consistant
with the white color of the backlighting. Perhaps they changed it for
newer models.

```
AMSAT.ORG Mailing List and Remailing Services
=============================================

revised: 10/20/93 kb5mu

AMSAT-NA (the Radio Amateur Satellite Corporation in North America)
operates the Internet host AMSAT.ORG to provide for efficient
communications between people interested in the amateur satellite
program. At this time two services are provided: a message remailing
service and a mailing list service.

In the future, an archive of files will be accessible by anonymous
ftp or possibly by email. In the meantime, check the host ucsd.edu
by anonymous ftp for AMSAT-related files. Consult your local guru
for help on using anonymous ftp.

The message remailing service permits users to send each other mail
on the Internet without keeping track of each other's Internet
address. The remailing service allows each user to receive mail sent
to the address callsign@amsat.org, where callsign is that user's
amateur radio callsign, or other unique identifier. Mail sent to
that address will be routed first to the AMSAT.ORG host at UCSD in
San Diego, then remailed from AMSAT.ORG to the network address
specified by the user. In most cases, this process delays the
message by only a very few minutes.

The mailing list service groups subscribers into mailing lists to
receive certain types of messages. There are public mailing lists
available to anyone, and private mailing lists available only to
certain people (for example, AMSAT Board of Directors members or
PACSAT command stations). Currently the following public mailing
lists exist:

ANS AMSAT News Service

This mailing list carries official news releases from
the AMSAT News Service. These messages are posted in
a form suitable for direct posting to a packet radio
BBS system. Each message contains a Bulletin Identifier
(BID), which permits the message to be introduced into
the packet network at many places without resulting in
duplicate bulletins at any BBS. The primary purpose of
this mailing list is to distribute ANS bulletins for
redistribution (via the packet net or on AMSAT voice
nets), but individuals may also subscribe for their own
use. If your local packet BBS doesn't seem to get the
```

ANS bulletins reliably, you are encouraged to post the
ANS bulletins yourself.

Only authorized AMSAT News Service personnel should
send messages to the ANS mailing list.

AMSAT-BB AMSAT bulletin board

This mailing list carries general AMSAT information.
This information may NOT be suitable in content for
transmission via amateur radio, so automatic reposting
of AMSAT-BB messages to packet radio BBS's is discouraged.
The purpose of this mailing list is to provide a forum
for general discussion of any satellite-related topic.

Anyone may send messages to the AMSAT-BB mailing list.
Simply address your message to amsat-bb@amsat.org, and
it will be automatically forwarded to all subscribers
to the AMSAT-BB mailing list.

Editors of publications should ask permission of the
sender before publishing anything seen in AMSAT-BB
elsewhere, unless the posting was obviously a public
press release. However, posters should realize that
anything posted to AMSAT-BB is essentially public.

KEPS Keplerian Elements mailing list

This mailing list carries official postings of Keplerian
element sets for satellites of interest to radio amateurs.
Like the ANS bulletins, these messages are posted in a
form suitable for direct posting to a packet radio BBS.

Only authorized AMSAT News Service personnel should
send messages to the KEPS mailing list.

NASAINFO NASA related information mailing list

This mailing list contains information about current
and planned NASA space missions. Be forewarned: at times
this mailing list delivers many large messages.

SAREX Shuttle Amateur Radio Experiment mailing list

This mailing list contains information and press releases
pertaining to SAREX missions.

To obtain any of these services, just send a message to the address

listserv@amsat.org

This address may be reached from CompuServe MAIL as:

>INTERNET:listserv@amsat.org

For the moment, the maintenance of the AMSAT.ORG mailing lists and remailing aliases is done manually. Later, this service will probably be automated and you will have to follow a strict message format. For now, you may send requests in free format. They will usually be processed within a few days. In general, you will not receive an explicit reply to your request. Be sure you specify:

1. Which mailing list(s) you want to receive

2. Your callsign, if any

3. The Internet address to be used, if different from the one in your From: header.

You should not send messages about your subscriptions to any of the mailing lists. Send them to listserv@amsat.org instead. This includes questions, requests for changes, requests for information about mailing services, and complaints.

The list of amateurs who may be reached via the message remailing service may be obtained by requesting the "address book". Note that the address book as distributed contains only the callsigns of the available addressees, not their actual Internet addresses. The address book is updated occasionally, and does not necessarily contain the very latest information.

You may request to be added to the list, to be deleted from the list, or to have your Internet address changed on the list. Please include your callsign if you have one. If you don't have a callsign, that's OK, but please say so. If you have more than one Internet address you want to have available on the AMSAT.ORG remailer, you may so specify. For instance, if you have a regular Internet address and a CompuServe account, you may appear in the address book as both w1xyz and w1xyz-cis. Mail sent to w1xyz would go to your Internet address, and mail sent to w1xyz-cis would go to CompuServe. MCImail accounts have the form w1xyz-mci, and so on.

You may also subscribe or unsubscribe to any of the public mailing lists described above. Send a message to listserv@amsat.org, specifying clearly which mailing list(s) you want to add or drop, and giving your callsign if you have one. When you subscribe to a mailing list, you will automatically be added to the remailing service as well, because the mailing lists are maintained by callsign. If you have more than one address listed in the remailing service, please indicate which one(s) you want the mailing list messages sent to.

Additional mailing lists, public or private, can be set up as needed. Send mail to listserv@amsat.org for details.

Questions about any service offered by AMSAT.ORG may be directed to listserv@amsat.org as well.

Frequently-asked Questions and Complaints (and Answers):

1. Why do I get "MCI Mail Rejected a Message" responses each time I send a message?

MCI won't accept mail from CompuServe via the Internet. This is just corporate policy. There isn't anything we can do about it, short of banning MCImail addresses from the mailing lists.

2. Why did the mailing list messages suddenly stop coming to me a few weeks ago?

Something may have been temporarily wrong with mail delivery to your site. If a message to you bounces back to the list maintainer, you may be removed from the mailing list without notice. If you think this has happened to you, send a message to listserv@amsat.org and ask.

3. I never get an answer from w1xyz when I send him mail via AMSAT.ORG.

If his mail isn't getting delivered, you *should* receive some kind of automatic message indicating there has been a delivery problem. If you don't get such a message within a few days of sending your message, chances are that your message made it to the addressee's mailbox. However, the addressee may be behind on reading email, or may simply not bother to reply, and there isn't much we can do about that.

Another possibility is that the message you sent contains a bad "From:" address. This will prevent the recipient from replying to your message. If you suspect this may be happening, include your real Internet address in the text of the message. If you find that this is happening, please complain to your system administrator.

4. My computer says "unknown host" whenever I try to reach AMSAT.ORG.

This indicates a problem with domain name service. AMSAT.ORG *is* a fully official domain name, and your host should be able to find it. Check with your local network administrator (tell him to check the nameserver at ucsd.edu). As a workaround, you may be able to use an address of the form
callsign%amsat.org@ucsd.edu
to force the message to pass through the UCSD mail host on its way to AMSAT.ORG. If your local system can't find ucsd.edu, you're in trouble!

5. I have an important announcement I'd like to make. Can I send it to the ANS mailing list?

Not unless you're an official ANS station. You may send it to AMSAT-BB, and/or submit it to the ANS editor (wd0hhu@amsat.org) for possible inclusion in the next issue of ANS.

And no, the computer doesn't enforce this rule. You're on your honor.

6. I can't get Internet access!

Yes, you can. It may not be very easy or cheap, but you can. You have a number of alternatives:

* find a local connection. Most hams have inside connections they don't even know about. If you know somebody at the local university or at a high-tech company, ask them if there's any way for you to have access to the Internet through their system. Sometimes the answer will be yes. If you are in a position to grant access, *please* make this service available to local AMSAT folks.

* check with your local BBS. Some telephone BBS systems have access to a mail gateway that will allow you to send and receive Internet mail. This may not be the fastest way to receive the mailing lists, but it is probably the cheapest if you don't have free access.

* subscribe to a pay service. There are several systems that offer Internet access for a fee. CompuServe subscribers can find a list in the Internet library of the TELECOM Forum. AMSAT does not maintain a current list of public Internet providers.

* subscribe to a commercial service that provides Internet access. America Online, Genie, and Delphi are among such services. Check around to find the one with the rate structure that best matches the way you expect to use the system.

* subscribe to CompuServe. Many subscribers to the mailing lists receive their mail via CompuServe. This is an expensive choice, but it is very easy and available in most developed parts of the world. CompuServe is often a local telephone call, and they have an 800 number for people in the less-populated areas of the US. CompuServe starter kits are available at computer stores, and there's often one included free when you buy a modem.

CompuServe users can send mail to Internet addresses by adding
>INTERNET:
before the address. The ">" and the ":" are required, and "INTERNET" must be in uppercase. For example, to send mail to w1xyz, you can use the address
>INTERNET:w1xyz@amsat.org
from CompuServe MAIL. Note that there is no way to communicate between Internet and a CompuServe forum like HamNet. The Internet gateway only works for CompuServe MAIL.

There may be an additional surcharge for receiving messages from the Internet on CompuServe. As a CompuServe subscriber, your mail may also be subject to additional delays. Worse, CompuServe limits the amount of mail you can have pending in your mailbox, so you must read your mail frequently. Check with CompuServe for details.

7. There's too much XYZ being posted to mailing list ABC!

It's not possible for the mailing lists to contain exactly what you find interesting. If we are to share information freely, all subscribers must be prepared to cope with a certain amount of traffic they find boring or useless.

Sometimes it becomes a clear problem, with one subject generating so much traffic that it becomes a burden on a more general mailing list. In those cases, a new mailing list can be created to make it possible for only those who are interested to receive the information. However, there is a practical limit.

8. I posted a message to mailing list ABC, and I got a bunch of bounce messages back.

Most automatically-generated problem report ("bounce") messages should be automatically routed to the list administrator. These messages usually signal a transient problem somewhere in the network. Often, the problem is at the receiving end. If a particular subscriber generates repeated bounce messages, that subscriber will be removed from the mailing lists.

If by some mischance a bounce messages comes back to you, the poster of a message to one of the mailing lists, please forward the bounce message (or a sample if many arrive) to listserv@amsat.org. Please forward the entire message including headers as received. If the echoed text is large, you may edit it down, but preserve all headers and bounce message text.

Do NOT forward bounces resulting from sending messages from CompuServe to MCImail. There's nothing to be done about that.

9. How do I get a password for AMSAT.ORG?

You don't. There are no user accounts on AMSAT.ORG. When you get an alias on AMSAT.ORG, that only allows others to send mail to you as yourcall@amsat.org. It doesn't mean you have an account on AMSAT.ORG.

10. How do I log in to AMSAT.ORG?

You don't. There are no interactive services on AMSAT.ORG.

11. Is there anonymous FTP on AMSAT.ORG?

Not yet.

2871. 6146A vs 6146

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-27 07:56:46 UTC
From: Bob.Albert@f943.n102.z1.fidonet.org
Message-ID: <770271263.AA03413@mcws.fidonet.org>
Source record: 266248

Dave, I'm not sure of myself here but I believe the differences among
the various 6146 tubes is in plate dissipation rating. You can
interchange them regardless of the warning on the back of the rig.
I wouldn't mix them in a rig though; there may be minor differences in
capacitance etc. and they may not share current well if you mix them.
Neutralization ought to be done every time you change tubes anyway, or
at least check the settings. When I used those tubes I did find that
they were close enough that I didn't have to readjust, but I don't know
if that would be everyone's experience.

Derek,
They're bugs on radar detectors here in the People's Republic of
Virginia, too. It seems that most of the police have this "keep the
world safe from the riff-raff (i.e. non-cops)" attitude and the state
(oops, Commonwealth) legislature just wants the money. To @#!! with
prevention, they want the CA$H. Geez, even CT allows radar detectors
now (or at least COMB will sell them there now!)

John "not a lawyer either" Tant

2873. Oakland ham area Index files

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-27 11:47:58 UTC
From: wy1z@bach.coe.neu.edu
Message-ID: <WY1Z.94May27074801@bach.coe.neu.edu>
Source record: 266130
Cross-posted to: rec.radio.amateur.misc,alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave

I have created a new type of Index file for the oak.oakland.edu:/pub/hamradio
FTP area.

The new index file is named 0-Index2.txt, and is in the format of:

/directory_path/name_of_file, file description

which is great if you want to perform a grep of a particular program.
The result will be an instant directory path to retrieve the file from.

The other index file isn't going anywhere. It's format is still:

/directory_path:
names of files Brief description of file

The final index file, which is more confusing, but will continue to exist,
is the vanilla recursive subdirectory listing, ls-lR.

> based on the "cold cranking amps?"

What Ken Nishimura said! The deep-cycle batteries are designed for putting
out a constant current for an extended time, so they _are_ rated in
amp-hours. If you're going to buy a new battery specially for this
purpose, the deep-cycle ones are worth the small additional price over a
car battery. If you get the car batteries free (or have a used one or
something), the 80 amp-hour assumption is good, but remember this is not a
deep cycle device, so you don't want to drain out anywhere _near_ the
full 80 amps; 40 or 50 amp hours is a much safer limit.

This thread has contained statements such as: "Use of Q signals on phone doesn't make much sense...", "I'm newly licensed 3 weeks now, but I've been listening on my scanner for 6 months.", "if you say "What is your QTH?", what you are saying is "What is your what is your QTH?". etc.

These are the traditions of hame radio. Traditions don't have to make sense. They are the things that characterize and identify the hobby. I believe it is detrimental to attack these traditions, for you are attacking the history and very soul of amateur radio. You must remember that hundreds of thousands, nay, millions of your brother amateurs laid the foundation of this great hobby.

For those who chastise using CW abbreviations on phone, let me ask: How would you call CQ without using a CW abbreviation? How do you talk about DX and DXpeditions without using CW abbreviations? For that matter, how do you talk about CW without using CW abbreviations? See my point?

Please try to meld with the amateur radio fraternity rather than tear it down. You will feel better and the hams you belittle will feel better.

i am seeking advice on starting a amateur radio club. last month a group of us met and discussed forming a club here at work - so far, around 70 hams have shown an interest in participating.

at the first meeting, the floor was open for suggestions of activities - education/upgrading functions, having guest speakers, field day participation, and contesting were a few activities suggested. does anyone on the internet have any other suggestions for club activities?? is there any "lessons learned" advice anyone can give to us?? any information provided would be greatly appreciated.

thanks,
ke4edy

p.s. we also have an opportunity to purchase our own 2 meter repeater station. any advice on this??

Jack,
Up here in Ozaukee Co., WI we use the "straight" call to
break into a QSO or to indicate that we are making a final
transmission. To differentiate the times when we feel that
10 minutes hav (or will have) passed since the last ID we use
the phrase "for ID". I am sorry if this offends you.
Don't you think - in the totality of Amateur Radio -
this is rather insignificant?

The FT101ZD is a great rig, I've been very happy with mine. Last field day, I had it and an ICOM 735 side by side to operate on 15 m. and after a swapping back and forth a couple of times we stuck with the ZD for the rest of field day. Nothing real specific, just easier to use, seemed to have better success punching through the qrm. With tube finals it is more forgiving of novice errors. Great audio, the switches and knobs are large and more reasonably spaced, the led's easier to read, the military ruggedized case more robust. There's a guy in our club who has an FT-102 he's fully restored, new paint job, decals, knobs etc. all from Yeasu, which he's been offered a 1 for 1 swap for a new rig for and turned down. Don't know about the 901.

Do you want to BUILD or BUY the RF portion?

>To say it in a (too) simple way....we want to "replace" the
>existing coax-cable in the network with radio-signals....
>preferably digital ones....but we dont know yet.

There is commercial RF narrow-band and spread spectrum gear
capable of mega-bit per second (and greater) data rates
that can cover over 10 miles when using a beam antenna.
For the SS gear, you do not need an FCC licencse of any kind.

Thae amateur radio community will be unable to provide any
high data rate solutions. Then again, the commercial stuff
is not cheap! Expect to spend several thousand for high
data rate spread spectrum equipment that has a range greater
than a few hundred feet. For the shorter distances, it's
not that expensive compared to the cost of a contractor
or consultant doing the LAN wiring for you.

For the high-end, high $$ stuff, try...

Transformation Techniques
CLeveland, OH
216-243-9033

They have a great 5 mile 19.2KBPS SS station that accepts
serial data input and blasts it out over RF. Outs it
comes on the other side. ABout $1000.00 per seat.
Their Mega BPS stuff is several thousand per station.

Cylink
Sunnyvale, CA
408-735-5800

38.4 KBPS Spread Spectrum "modems"
1000 feet range with the stubby duck through a congested building.
30 miles line of sight with beam antennas.
All SS, so no license required. Plug and play!

Of course, there's always amateur radio packet! Study hard,
pass your test, wait 4 months for your license, spend about $1200

bucks to set up two packet stations (including power supplies, TNCs, radios, coax and vertical antennas) and then talk to each other at 1200 baud! WOW! MyT impressive. ;-))

For only twice the cost of the amateur layout and a lot less work, you can be on the air at 38.4KBPS with SS gear and no noise from the FCC.

See, I knew I could turn this into another debate! ;-))

>every 4-5 months. And I didn't even operate that often!
>

I used 6HF5's in SWAN 500. They input was about 350W in on CW and I believe at least 500W on SSB. I tuned the transceiver in by sending fast dots in CW to halve plate losses, and the tubes showed no sign of deterioration over the period of 2 years and quite active work.

I would love to have an amp with 4 6HF5 tubes. SWAN 500 was the only rig where many more people could hear me than I could hear them. Being often one of the first to sign on 80 m DX nets in Europe, I often could not signal reports of weak DXs.

I compared IC-735 with SWAN 500. The Icom routinely got reports 2 S lower! So in summary, TV tubes are great peak performers but risky for inexperienced ones. This does not disagree with the QST.

>> I haven't been doing -The Wrong Thing-!)
>>
>Fine idea, but...
>
>I'd be interested in knowing what you look for and what this test tells
>you about the level of the charge.

I have a bunch of AA, C, and D nicads, which I recharge often for the
use of my kids to run their toys.

I OFTEN need to know, is this C battery charged or not. So, ...
Doing this for AA, C and D cells shows my what the SHORT CIRCUIT
amp condition of these batteries are. And whether it will work
Michaels super zoomer, spinning flashing Turtle toy.

Every radio shack in the world has a little battery checker. The
circuit has to be incredibly simple. Like a 50mA meter and a resister.
So, by posting this query,I had hoped to get a response like,

To check a 10 Amh battery at 12 volts you need a 7zillion ohm resister,
To check a D cell, get a 2 micromilli ohm resister.

I GET IT that I shouldn't short my Ampmeter across anything big, (but I
knew that cause my Electrical Engineer friend 'accidentaly' tried to measure
the amps coming out of a wall socket, and yes the meter actually jumped
before it fried.)

So, I still don't know how to check a larger, 2-10 Ahmhour battery
to determine its actual amp-hour. But I do have this little meter
with a resister, that I ripped out of a recharging unit, that has
a nice scale that says good/charge.

And that's why I want to know the amp status of a battery. So I'll
know if it needs charging before I get out in the field.

So, what resister for what rating?

Chris,

I read what u sed abt batteries
==========
> Chris Moore
> N6IYS
> cmoore@cancun.rose.hp.com
==========
I think you need to get a ceep cycle battery such as for trolling motors.

I have three such batteries now. (My camping trailer runs on 12 volts exclusive of the air cond.) My rule is when seeking out such a battery is if it has the word "starting" anywhere on it, I don't buy it.

But of course a plain old car battery will work in a pinch. Goodness knows that before all those D.C. batteries were available, hams used 12-V car batteries.

2897. PRB-1 access and approaching city hall

Newsgroup: rec.radio.amateur.misc
Date: 1994-05-27 16:14:28 UTC
From: rundall@rtsg.mot.com
Message-ID: <2s5694$atk@delphinium.cig.mot.com>
Source record: 266177

I would like to get a copy of PRB-1 via anonymous FTP,
telnet, email etc. Does anyone know where I could get
such info (and any related documents)?

Also, I've heard some horror stories about how hams in
the surrounding Chicago suburbs have had to battle the
local town-halls. Being a new home-owner, I am concerned
about these issues. Last week I bought a house in a town
(Lake Zurich, IL) with several (5-10) hams in my neighbourhood
according to the CD-ROM database but none of them have
towers. I guess they could be inactive - but NO towers in
my part of town?? It's a little intimidating.

From other local suburbs, I've heard hams make comments like:

"Don't say you need a permit for a 'tower' rather 'an
antenna support structure'. 'Tower' raises red flags
and leads to trouble."

"Be careful when approaching your local government - there
have been cases where hams have asked about the existance
of such ordinances and a week later the city council passed
a new tower restriction that they had never considered."

"Unless there is a DX'er in your town that happens to be a
good lawyer with lots of time on his hands, don't bother
putting up a tower you'll have to take down."

"Don't ask for permission - it's easier to ask forgiveness!"

Now I realize that this may be 50% urban folklore and 50% truth
but comments like these are quite intimidating. Any guidance
would be appreciated.

I do know that when we were looking into building a house with one
of the local builders that put up these big developments (~200
homes) I was told "You want to put up a TV antenna - that's fine,
but a ham antenna?".... After digging through some papers, "I'm
sorry but we have a 'community covenant' separate from the town
ordinances that states 'no satellite dishes, or external antenna
allowed - period'". The manager equated ham antennas with never
mowing the lawn, leaving broken/rusting cars in the yard and painting
the house plaid. This is especially stupid because their big concern
was "aesthetics" - however, at both of the developments I've been to
by this builder there were cell-sites (~150' towers) with-in a mile
of their little Utopia. Needless to say, I told them how dumb this
was and walked out.

How does PRB-1 help those that moved into one of these communities
(this one was by Cambridge Homes - one of the largest builders in
Chicago-land) and later decide that they'd like to become hams?
I guess future hams are doomed to attic, tree, flagpole and rubber-
duck antennae.

Well, I use two deep-cycle batteries (24v system) in my wheelchair, and I
get about 10 miles at 7 MPH! :)

BTW, that's NOT deep-cycles per second! :) :) :)

The other, even older reason goes back to the very annoying
characteristic of older rigs and "Linears" which used large,
noisy relays to switch from TX to RX. Besides a clipped first
syllable, the operator and listener would both be subjected to the
sound of a loud "THWACK" (onomatopoea?) when the relays kicked over.
Operators using speech clippers and compressors added to the
interesting characteristics of the changeover sound. The long
AAAAAhhhh's did indeed minimize this. It is still odd, though,hearing
people do it on VHF repeaters.

While I agree that this is the _most likely_ explanation, I'm not sure that
your references have done anything more than speculate. There've been too
many conflicting accounts over the years to say it's clear-cut. I'd have
to vote for, "Nobody knows for sure, but this is the best candidate."

Certainly "HAM" and h.a.m. are recent variants that seem to have first
appeared on the Internet; I've never seen them in print during the past 40
years.

> 73 es GE from Jeff. Yes, I'm a geezer but I'ts taken me years to qualify!

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
May 27 to June 06, 1994

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008
SKYCOM Announcement: (403) 756-2386

SKYCOM POTENTIAL STORM CONDITION HF PROPAGATION FORECAST

We have developed a special focused HF propagation forecast for 31 May, which is expected to be the most disturbed day for the anticipated disturbance expected to begin on 28 or 29 May. A special global map of Maximum Usable Frequencies for 4,000 kilometer paths has been generated by our SKYCOM software and has been made available for anonymous FTP at the site: "ftp.uleth.ca" (IP # 142.66.3.29) in the directory "pub/solar/Iono". Grab the file "31may00z.gif".

The forecast itself has been distributed separately, but can also be found at the anonymous FTP site "ftp.uleth.ca" in the directory "pub/solar/Iono" under the filename "forecast.doc". For those who are interested in conditions for that period or what SKYCOM can do, consult the forecast. It was prepared exclusively from information gathered by the SKYCOM software and reveals a small portion of the available features. On our BBS, these files may be found in the "Solar Geophysical Data - 1994" file area under the same filenames.

For more information regarding the new SKYCOM HF Propagation software, call the recorded SKYCOM announcement listed above or send e-mail to: Oler@Ultrix.Uleth.CA or COler@Solar.Stanford.Edu. This is a software package no serious radio communicator or listener should be without.

```

CONFIDENCE LEVEL: 65%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

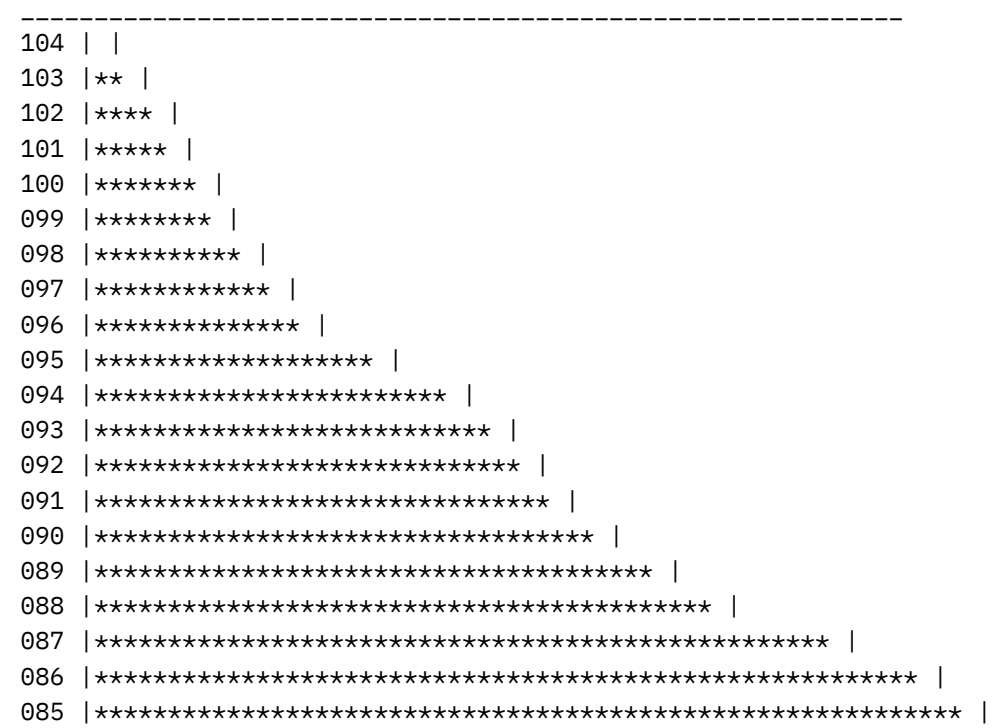

Chart Start: Day #087

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

Remember, though, that the police do not always behave in a legal manner
(ask Rodney King), and you can be harrassed for doing things around the
police that you have a right to do. Unless it's a major issue, I'd prefer
to avoid the hassle than to assert my right to announce a speed trap.
Defending yourself in court is expensive even when you're _not_ guilty.

I have heard a station around here signing "commode mobile" which I think
should rightly have been stated "commode immobile" but I wasn't right there
so what do I know.

: 'Allo Cecil! As a "Real Live Cockney" from the East End of London, I 'ave
: never 'eard of this one!
: 'ave a nice day!
: Ron, VK5RY in Souf Haustralia.

'Allo Ron, we 'ave a dozen or so Englishmen working 'ere at Intel and they agree that in England, the word "ham" is a slang form of the word "amateur" and the term originated before radio was invented. They think it probably originated long, long ago in the theatre, as in an actor 'amming it up.

Ham, 'am, and amateur could be closely related. Are you familiar with the term 'am as applied to an actor (usually an amateur actor)?

Maybe those who append "mobile" to their calls are old guys who picked up the habit when it was a _requirement_.

Actually, on our local nets, preference is given to mobile stations who check in, the assumption being that they may drive out of range before the net gets around to their turn. They get to speak first, so they have incentive for saying "mobile" when they check into the net.

There's one chap who apparently _never_ operates from home; we're all convinced that "mobile" is really part of his callsign.

What is the present status of the law requiring "moblie" (for a station that is designed to move around, whether or not it is) and "portable" (for a fixed station that is not at the station location) ?.. and the law requiring your present location number if your station is in a different area? Am I correct in that all of this has gone away now that station licenses do not exist?

Jose

PS... don't ask how a station can be "not at the station location"... you know what I mean! :)

2909. Daily Summary of Solar Geophysical Activity for 26 May

NOTE: The Effective Sunspot Number for 25 MAY 94 was 25.4.
The Full Kp Indices for 25 MAY 94 are: 3o 5+ 4- 4o 2- 3- 2o 4-
The 3-Hr Ap Indices for 25 MAY 94 are: 15 57 25 30 7 12 8 22
Greater than 2 MeV Electron Fluence for 26 MAY is: 4.3E+07

SYNOPSIS OF ACTIVITY

Solar activity was very low. All regions were quiet.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field was quiet to active. Storm conditions
occurred at some high latitude stations from 26/0600-1200Z.
The greater than 2 MeV electron flux was moderate except for a
5 hour period, from 26/0500-1000Z, when it was normal. (STD:
Overall > 2 MeV electron fluence levels are near-normal.)

Geophysical activity forecast: the geomagnetic field is
expected to be quiet to unsettled for the next two days. A
recurrent disturbance is expected to start by the end of the
third day.

Event probabilities 27 may-29 may

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 27 may-29 may

A. Middle Latitudes
Active 15/30/30
Minor Storm 05/25/25
Major-Severe Storm 05/15/15

B. High Latitudes
Active 15/30/30
Minor Storm 05/25/25
Major-Severe Storm 05/15/15

HF propagation conditions were near-normal over most
regions. Minor signal degradation was observed over the high
and polar latitude paths between 06:00 UTC and 12:00 UTC due to
minor storming in those regions. However, conditions returned
to normal levels by 18:00 UTC. Sporadic-E was also prevalent
over some middle latitude stations. No changes in propagation
are expected over the next 24 to 48 hours. The recurrent
coronal hole disturbance noted above will begin degrading high
and polar latitude signals on 29 May. Thereafter, effects of
this activity will spill over into the middle latitude regions.

EVENTS WITH SWEEPS AND/OR OPTICAL PHENOMENA FOR THE LAST UTC DAY

Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
------ ---- ---- ---- ---- -- ------ ------ ---
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

: Same I guess for half the calls that add "mobile". I mean, for the most
: part I think it's great that the caller is driving around or whatever, but
: 9 times out of 10 it really makes no difference to me whether you're
: driving, walking, or standing on your head during your conversation. There's
: hardly anything that can interrupt or interfere with a conversation while
: mobile that couldn't also happen if you're "immobile" -- including walking
: through your house if overpasses are an issue. Even still, if
: I tell the person that their signal is bad, I really don't expect them to
: pull over to the shoulder anyway. Perhaps I should have some fun with this
: habit and say things like "KD6QPY scratching" or "KD6QPY digesting".

I use the "mobile" tag because depending on time/net/amount of traffic,
the mobile stations get priority. I guess at one time, the "mobile" was
required by the FCC just like a KG0IL/0 would be required if I was not at
my home station while transmitting. The rules have been relased a bit....
I have heard several of the other activity related calls but most of them
seem like they are just trying to be cute. It does not bother me when I
here a Mobil or Portable but some of the other stuff gets irritating...

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: The rules say you should ID every 10 minutes during a QSO. And it's
: a bad practice that impedes the natural flow of conversation to say
: your callsign at the end of *every* short transmission on a repeater.
: So it's often necessary to ID after being silent for a few minutes to
: stay legal. Since you haven't signed, you're still part of the QSO,
: and need to ID at 10 minute intervals. An often satisfactory alternative
: is for everyone to ID when the repeater does.

: Gary

I believe the rules state the ID should be at least every 10 minutes and
at the end of the last transmission. The only time I do use the short
transmission ID stated above is when traffic is heavy enough on a net that
I may not get my next transmission for 10+ minutes. The FCC may
understand but why chance it.

Good morning. It's Sunday the 29th of May and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

All listeners to this broadcast, whether RSGB members or not, are invited to the RSGB Headquarters Open Day to be held next Saturday the 4th of June. This is the perfect opportunity to call in and meet the staff, and have a tour round the building. There will be various trade and local club stands, and refreshments can be purchased. Admission from 10.30am until 4.30pm. A map of how to reach headquarters appears in June edition of Radio Communication and talk-in will be on 2 metres channel S22.

The RSGB invites all radio amateurs to attend a Regional Meeting to be held next Sunday, the 5th of June, at the Forte Crest Hotel, near Brighouse, West Yorkshire. Turn off the M62 motorway at junction 25 and go towards Brighouse, the hotel is on the right a short distance from the junction. Coffee will be served prior to the meeting which is scheduled to start at 12.15pm. These meetings are for members and non-members of the Society to meet Council Members, Society Officers and staff to discuss the workings of the Society and amateur radio related matters. For further details, contact RSGB Zonal Council Member Peter Sheppard, G4EJP, on 0964 550397.

We have been advised that there are two places still available on the coach trip to Friedrichshafen for the Hamvention in June. The coach leaves Nottingham on the 22nd of June returning to the UK on the 27th of June. The trip includes three nights in Lindau. More information can be obtained from Julian Mayfield, G0LXX on 0602 211069.

During May, the number of Instructors registered with the RSGB in the Novice Licence Training scheme topped the one thousand mark. This is excellent news and is an indication that amateurs are prepared to pass on some of their expertise and enthusiasm in training new-comers to the hobby. They are to be congratulated for the work they do in training these new radio amateurs. Many instructors have said that their reward is hearing their students using their new call signs and obviously enjoying every minute of their new found hobby.

The RSGB's Electromagnetic Compatibility Committee, or EMC, is trying to increase its network of coordinators, who deal with members EMC problems by telephone. Society members who feel they have the relevant background and would like to apply, should write to the Committee Chairman Robin Page-Jones, G3JWI. His address is correct in the RSGB Call Book. Areas in which additional EMC coordinator coverage is required, is in the Birmingham area, Northampton, Swindon, Cardiff, Ipswich, Carlisle and

Sheffield.

The Annual AMSAT-UK Colloquium takes place from the 28th to the 31st of July. There are still some places available. Full details and a booking form can be obtained by writing to AMSAT-UK, 94 Herongate Road, London E12 5EQ. Completed forms should be returned to AMSAT-UK, by the 15th of July. AMSAT-UK has recently donated sixty-eight-and-a-half thousand pounds to the Phase 3D Fund. This will be used to purchase a high capacity battery which should have a life span of between 10 and 12 years. The Phase 3D satellite is due to be launched in July 1996.

The Japan Amateur Radio League has advised us that permission has now been granted for Japanese radio amateurs to increase their use of the 3.5MHz band. The extra segment allocated is between 3.747 and 3.754Mhz.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From the Austral Islands, JA1BK will sign FO0MIZ/A from now until Monday the 30th of May on all bands 80 to 10 metres on CW and SSB.

From Solomon Island, JA1OEM will sign H44/JA1OEM from now until Friday the 10th of June. Activity will be on all bands 10 to 160 metres, mainly on SSB with some CW activity.

From Aaland Island, a group of Finnish operators will sign OH0AAQ for the CQ WPX CW contest and a few days after. Outside the contest they will be active on the WARC bands.

And from Gambia, G0UCT and DK2OC will sign C56/own-call from next Friday the 3rd until Friday the 17th of June. Activity will be on all bands 10 to 80 metres on CW, SSB and RTTY.

Now the rallies for today Sunday the 29th of May:

The East Suffolk Wireless Revival's Ipswich Rally is being held at the Maidenhall Sports Centre, Stoke Park High School, Ipswich. Doors open at 10am. The rally features trade stands, local club stands, a Novice stall, a bring and buy stall and a car boot sale. A new feature this year will be a drive-in Antenna Test facility. There is also a vintage wireless show and other displays. Refreshments will be available. Talk-in will be on 2 metres channel S22 by GB4SWR.

The Plymouth Radio and Electronics Fair is being held at Coombe Dean School, Charnhill Way, Elburton, Plymouth. Doors open at 10.30am. The event has over 25 stalls featuring electronic, computer and radio components, a large bring and buy stall and a bookstall. Refreshments will be available and talk-in is on 2 metres channel S22.

Now the two rallies we know of for next Sunday the 5th of June:

The Burnley Radio Rally is to be held at the St Peters C E Primary School, Church Street, Burnley. Doors will open at 10.30am. The rally features trade stands, local club stands and a bring and buy stall.

Refreshments will be available. Further details available by telephoning 0282 37533 or 451342.

The Spalding Amateur Radio Exhibition and Rally is to be held at the Springfields Exhibition Centre, Spalding, Lincolnshire. Doors open at 10am. The event features many trade stands and a car boot sale. Refreshments will be available. Further details available from G4TWR on 0775 722940 or G7CWM on 0775 680447.

HF contest news now:

The CQ WPX CW Contest will finish today, Sunday the 29th of May at 2359 after 48 hours. All bands from 1.8MHz to 28MHz but excluding the WARC bands can be used. No other information available but see March RadCom page 18 for other details.

The RSGB HF National Field Day Contest takes place next weekend, starting at 1500 UTC on Saturday the 4th and finishing at 1500 UTC on Sunday the 5th of June. See February RadCom for further details.

Next some VHF contest news:

The RSGB 144MHz Single, Others and SWL Contest finishes today Sunday at 1400 UTC after 24 hours. See the February edition of RadCom for further details.

The RSGB 50MHz Trophy Contest will takes place from 1400 until 2200 UTC next Saturday the 4th of June. There are five sections, Multi Operator Fixed or Portable, Single Operator Fixed or Portable and Listeners. See February RadCom page 83 for further information.

The IARU 50MHz Contest is scheduled to run from 1400 UTC on Saturday the 4th, until 1400 UTC on Sunday the 5th. See February RadCom page 83 for further details.

The Kidderminster 70 centimetre repeater GB3KR on 433.075MHz, channel RB3, has been switched off by the keeper, while maintenance work is being done on the aerial tower. The keeper G8NTU regrets any inconvenience to users, until the work is completed and the repeater is reactivated. For further details regarding the repeater contact, G8NTU whose address is correct in the RSGB Call Book.

Next some of the Special event stations that will be active during June to commemorate the 50th anniversary of D-Day, include:

GB50DD will be operating from the Veterans Tent on Southsea Common, Hampshire by members of the Horndean & District Amateur Club. Operation to be on all bands, from Wednesday the 1st, until Tuesday the 7th of June. For further details contact Stuart, G0FYX on 0705 472846.

GB50OL will be aired Ray, G0EYM and Richard, G0RNM in conjunction with the members of the Bedford and District Amateur Club from the Control Tower of the former RAF station, Little Staughton, Bedfordshire, home of the Pathfinders. The station will be operational from next Friday the

3rd, until Tuesday the 7th of June.

GB50NL will be aired by members of the Loughborough and District Amateur Club from the "Carillon" War Memorial and Museum, Queens Park, Loughborough. The station will be operational from next Saturday the 4th, until Tuesday the 7th of June on 80, 40, 20 and 2 metre bands.

GB4DD will be aired by members of the Yeovil Amateur Club from Digby Hall, Sherborne, Dorset. The station will be operational daily from 0900 until 1800 UTC from next Tuesday the 31st of May, until Tuesday the 7th of June using authentic WW2 equipment on 3.5, 7, 10 and 14MHz. Further details from Cedric telephone 0258 473845.

GB5DD, will be aired by members of the Radio Club of Thanet from the wartime site of "HMS Robinson", at Richborough, Sandwich, Kent. Operation will be from next Saturday the 4th, until Sunday the 12th of June. For further information contact Buster, G3OPL on 0843 597916.

GB2SPD, Shoreham Port Defences, will be aired to celebrate the 50th anniversary of D-Day and the activity in Shoreham Port at that time by the Worthing and District Amateur Radio Club on Sunday the 5th of June from 10.30am to 5pm using HF bands and VHF. For further details contact G4GPX on 0903 753893.

GB6OL, will be aired by members of the Horndean & District Amateur Radio Club as part of Portsmouth 800 years celebration, from the 1st to the 5th of June. For further information contact Stuart, G0FYX on 0705 472846.

TM6JUN, will be aired by members of the American Association of D-Day Utah Beach Radio Amateurs from Utah Beach, from Saturday the 4th to Saturday the 11th of June. For CW check these frequencies: 3.544, 7.3, 14.044, 21.044 and 28.044MHz and for SSB, check 3.775, 7.070, 14.244, 21.344 and 28.444MHz and for VHF 144.244MHZ.

The REME Club Station, callsigns GX3IHH and GX6IHH will be aired from 0500 to 2100 UTC on Monday the 6th of June. Operation will be on all bands 80 to 10 metres, including the WARC bands and also on 2 metres, SSB and FM and 70 centimetres on FM.

A list of the many other Special Event Stations taking part in the D-Day celebrations appears in June RadCom.

And now the solar factual data:

The period from the 16th to the 22nd of May has seen solar activity remain at very low levels; no flares were reported and no M or X flares have been reported since last February. Sunspot indices have remained low and meaned at about 45. With the more active side of the sun coming into view, solar flux levels started to climb and reached 95 units by the 17th, the highest levels since March 5th, but declined slightly by the 22nd giving an average for the period of 90 units. The 90 day flux mean was 86 units on the 22nd.

The geomagnetic Ap indices declined from sub storm levels of 34 units on the 16th, down to quiet levels of 7 units by the 21st. Coronal holes are still troublesome but their intensity seems to be dying down. The electron Fluence levels are still very high due to the outbursts from the coronal holes, and stable ionospheric conditions will not return until these levels fall to nearer normal. The state has been 'Nil nothing to report' all the period. The aa indices as supplied by the British Geological Survey for the period 10th to 16th May was generally quiet, with the daily index for the week averaging 38.8 nanoTeslas about K3; the 13th was very quiet being only 11.7 nanoTeslas. The X-Ray flux levels have recovered and averaged A6.8 units; this was undoubtedly responsible for the increased solar flux levels. The monthly Ap indices for April was 26 units and the smoothed level for October 93 was 15.6 units.

I'll repeat the figures. Spots - 45; Flux - 90; Ap index - 13.4; X-ray flux - A6.8 April Ap 26 units.

Now the ionospheric data for Central France:

The F2 day-time critical frequencies at Poitiers as reported by Meudon are now being affected by the seasonal changes, so the daily highs are continuing to decline and averaged 7.0MHz. These levels are being reached around 19.00 hours. The darkness hour lows increase with the seasonal changes and averaged 3.6MHz, though there have been periods of spread F and Blanketing sporadic E. The lows are now centred about 04.00 hours.

I'll repeat the figures. Highs - 7.0MHz; lows - 3.6MHz.

Now the ionospheric data for the north:

The F2 day-time critical frequencies at Ekaterinberg averaged 5.6MHz and the darkness hour lows 3.1MHz

I'll repeat the figures: Highs - 5.6MHz; lows - 3.1MHz.

And lastly the solar forecast:
